From this perspective, according to UNESCO, the main drivers of tourism management are context-specific visions, common rules, control, and active development strategies. Context-specificity can be achieved through zoning that consists of dividing the given area into clearly designated zones listing the tourism activities and types of infrastructure that would be acceptable and should be developed in accordance with legitimate stakeholder needs. Anthropoc presence, the local environment, and their interactions are key to identifying homogeneous zones to orchestrate policies and resources from a risk-management perspective, which is particularly effective in case of disaster management (Becken and Hughey 2013).

Besides approval, licensing and control of tourism activities, guidelines and voluntary standards are typical policy tools aimed at ensuring a voluntary, effective, and inconsistencies-free regulation of tourism activities and infrastructures according to the vision and the zoning established (see ► [“Sustainable Tourism Products and Policies”](#)).

Since stakeholders and authorities are fundamental to boosting tourism development by catalyzing initiatives in tourism innovation, including product development, marketing and improvement of services, incentives, assistance programs, and facilitation of networking are typical instruments aimed at supporting virtuous dynamism and proactiveness in the tourism sector. Notably, the development and diffusion of best practice examples is a preferred way not just to pursue tourism development, but also to discourage unfavorable activities without solely enforcing strict command and control regulations or overcharging on exogenous, yet necessary to internalize tourism impacts, financial tools like tiered user fees, bonds, taxes, or levies.

Driving the development of sustainable tourism at an appropriate pace is thus a matter of

leveraging local accessibility to resources, both at the destination and company level (Leonidou et al. 2013), which calls for the definition of tourism management plans where possible threats and opportunities of tourism development are turned into widely agreed strategies after the careful assessment of environmental, social, cultural, political, and legal aspects. Modern planning approaches recognize that implementation success is a function of participation by neighbors and residents, local companies, tourism providers, restaurant owners, tourist guides, tours operators and tourism agencies, local authorities, local Non-Governmental Organizations (NGOs), educational institutions, research centers, visitors, and media. In fact, these stakeholders are expected to ensure an adequate understanding of what makes the specific context special and which are the key issues that should guide action. There is thus a virtuous – egoist to socio-altruist transforming – cycle between stakeholders’ pro-environmental perceptions and ecological understanding, education and knowledge sharing, availability of resources and opportunities, adaptive legislation and regulations, and collaborative planning and management (Imran et al. 2014).

Untapping the coordination potential of these stakeholders is important not only for providing the knowledge base for sustainable tourism planning, but also for exploiting potential synergies, e.g., related to the orchestration that destination management organizations (DMOs), travel agencies, and tour-operators might offer to individual service providers (e.g., hotels, restaurants, and tour guides) that usually tend to sell their own service overlooking the benefits from reducing redundancies and leveraging complementarities.

The importance of environmental knowledge management at the stakeholder level highlights the role of time as a necessary component of the nonstatic sustainable tourism planning process. As an example, this is particularly evident with reference to corporate sustainability in the hospitality sector, where socialization, externalization, combination, and internalization continue to be key processes for the creation of knowledge which enables organizations to successfully

address environmental challenges (Martínez-Martínez et al. 2015).

When turning sustainable tourism planning into practice, the region's tourism management vision, its main goals, and objectives have to be translated into a work plan to activate adequate resources and coordination of public and private efforts towards local governance (Battaglia et al. 2012). The workplan should also indicate how to monitor results against criteria for both sustainable tourism in principle, which are applicable to every region and every kind of tourism all over the world, and for local priorities adjusted according to the special conditions of the investigated area. As a result, global issues like greenhouse gas (GHG) emissions and climate change, apart from their capability to represent the vulnerability of a specific destination to fuel price shocks (Gössling et al. 2015) and the response of tourists to sectoral policies (Gössling et al. 2012), should be fairly balanced with those referring to local specificities in terms of energy use, wastewater and waste management, disruption of ecosystems, conservation of biodiversity, local food consumption, or safeguarding of employment and local culture.

In this framework, the more stakeholders that are involved appropriately in the design of feedback and review processes, the higher the probability of avoiding misuse of local resources and, thus, achieving a sustainable dependency of tourism activity on the local environment.

Sustainable Tourism Labels

If the process of sustainable tourism planning is by nature complex and multifaceted, communication with tourists should be developed on trustable and easily accessible information. To this end, compliance with standards is a common tool for providing stakeholders with explicit assurance that a business, product, process, service, or management system voluntarily meets or exceeds a set of baseline criteria or is committed to achieving progressively stronger sustainability.

Voluntary standards refer to product (e.g., EU Ecolabel) or process-oriented (e.g., ISO 14001),

certifiable (e.g., Blue Angel) or noncertifiable (e.g., ISO 26000) (see ► [“ISO 26000 Standard”](#)), private (e.g., Carbon Neutral) or public schemes (e.g., the European Eco Management and Audit Scheme – EMAS) that conform to third-party criteria (e.g., type I labels), to be distinguished from voluntary self-declarations that are (e.g., type III labels) or are not (e.g., type III labels) subject to third party audits on conformity to life cycle assessment criteria.

While the number of existing types of certification and ecolabels is continuously increasing, only the more credible ones have a widely known logo that enables consumers to recognize those businesses or products and services that meet certain sustainability criteria from those that do not, have sound and independent verification procedures that guarantee the transparency of criteria and evaluation, require certified companies to publish a statement of commitment to sustainable development, and have a set of defined standards/criteria or an environmental management system (or both) which must be met or exceeded, foster continual improvement and interpret the compliance with local regulations as a required and minimum standard, require a periodic follow up audits to renew the certification, entail to some extent a participatory approach involving stakeholders to define the standards and the design of the scheme.

Besides the emergence of these characteristics among trustworthy sustainable tourism certifications, it is worth noting the increasing number of profit-oriented institutions that are promoting sustainable tourism trademarks to market licensed products and build synergies among sustainable tourism providers under one umbrella brand. This might allow overcoming unfair concurrence of traditional competitors by developing economies of scale through cooperative marketing or a joint booking system and by providing a cooperate identity. Also, the legitimization of sustainable tourism trademarks depends on the extent to which these institutions guarantee the quality and compliance of the products and services of its members and communicate this guarantee to large numbers of consumers.

Summary

Besides relevant economic, social, and cultural impacts, tourism can generate relevant environmental impacts. In the last 30 years, in line with the increased awareness of stakeholders on sustainability issues, significant theoretical and practical improvements have been made in the field of tourism planning and management. Grounding on the increased sharing and understanding of lessons learnt at global level, the evolution of guiding principles and metrics is progressing hand in hand with the development and cross-sectoral integration of tourism policies. In parallel, the proliferation of product and management standards, tools, and labels reflects the interest that companies have in sustainable tourism as a means to achieve a competitive advantage.

Sustainable Tourism (Sustainable Development of Tourism, Sustainable Tourism Management)

Nil Sonuç

İzmir Katip Çelebi University, İzmir, Turkey

Definitions and Conceptualizations of Sustainable Tourism

A well designed and well-managed tourism can make a significant contribution to the three dimensions of sustainable development and has close linkages to other sectors and can create decent jobs and generate trade opportunities.

UN Resolution (2012, pp. 130/283)

In line with the above description of the United Nations, the “sustainable tourism” definition of the United Nations World Tourism Organization (UNWTO) is as follows:

Tourism that takes full account of its current and future economic, social and environmental impacts, addressing the needs of visitors, the industry, the environment and host communities.

UNEP and UNWTO (2005, p. 12)

Since the first appearance of the environmental concerns by Brundtland Commission with “Our Common Future Report,” the need for

the protection of the scarce resources of the world while developing the industry to meet the needs of current and future generations, conceptually the sustainability, is emphasized. Similarly, the debates about the conceptual definitions and practical implications of sustainable tourism emphasizing the aspect of sustainability applied to tourism enrich and still continue to develop.

Sustainable tourism evolved from the sustainable development concept. The original definition of sustainable development was provided by the Brundtland Commission in “Our Common Future” as “development that meets the needs of the present without compromising the ability of future generations to meet their own needs” (WCED 1987, p. 43). 1992 Rio Earth Summit indicated the important helping role of tourism for transition to sustainable development (Murphy and Price 2005, p. 174). As a result of the Rio Summit, Agenda 21 appeared as an action plan that might be adopted on local, national, and international levels.

The rapid development of tourism beginning after the second half of the twentieth century until the end of the same century resulted in benefits as well as losses in terms of the resources of the world. Positive impacts of development of the tourism industry can be mentioned as the contribution to socio-economic development and protection of socio-cultural and environmental values. Contrarily, massive exploitation of the natural and socio-cultural resources for tourism development have undesired consequences over the resources of the world such as:

- The extinction of fauna and flora species and wildlife in favor of urbanization and surpassed carrying capacity
- Loss of fertile lands in favor of over-construction and
- Forgotten original traditions in favor of commodification

The latter undesired results are aimed to be eliminated and the former desired benefits are encouraged by sustainable tourism theories and practices.

Attempts to conceptualize the theoretical framework of sustainable tourism and emphasize its opportunities of implicability have been made by different writers. In this context, especially Garrod and Fyall (1998) carries an unnegligible place and worth referring to by theoreticians and practitioners in order to comprehend the logic of sustainable tourism.

While developing tourism sustainably, it is essential to consider three basic pillars: economic, social, and environmental. The definitions of sustainable tourism emphasize the importance of balancing among the needs and expectations of the visitor, host, and destination. Parallely, in a following definition, sustainable tourism is defined as “a form of tourism that safeguards and enhances the natural and cultural assets of the destination, the resident population’s quality of life and life opportunities; satisfies the needs and expectations of the tourist market; is economically viable and achieves a return on investment for tourism operators; and achieves equity in the distribution of costs and benefits of tourism between the current and future generations” (Faulkner 2003, pp. 344–345). Additionally, Pearce (1992, p. 3) states: “Sustainability means that the average wellbeing of the global population rises over time.”

From the philosophical point of view of sustainable development mentioned by d’Allonnes, (2008), “the responsibility” is at the focus of attention. The traditional idea of responsibility is for the justification and paying the price for the damage of the past actions. The new concept of responsibility is closer to an obligation, for the future, and to others.

As for its nature, the tourism industry uses many socio-cultural and environmental resources in order to plan, produce, and offer the products and services to its clientele. Then, sustainable tourism can be defined as the style or aspect of management, policy, and planning of the tourism industry to create a sustainable tourism business with viable economic revenue for all concerned parties while respecting and protecting the resources for the needs of the current and future generations (Sonuç 2014).

All in all, sustainable tourism is a positive approach which attempts to reduce the tensions

among tourists, the host population, and the environment. It is an approach to realize the long term viability and quality of the natural resources and human resources. It is not against growth; however, it accepts that there are limitations to it. These limits may change according to the different places and to the varying management practices in those localities. With the sustainable tourism perceptive, the long term sustainability of tourism is guaranteed as well as its practicing field. With the commitment to increasing satisfaction, the sustainability of the tourist is also maintained. Fair resource allocation, increasing the quality of life of people, and contributing to World peace are among the current objectives of sustainable tourism (Sonuç 2014).

Important Dimensions and Aims of Sustainable Tourism

Centered around the three main pillars which are “economic,” “environmental,” and “social,” the 12 objectives of sustainable tourism are shown as “biological diversity, resource efficiency, environmental purity, economic viability, local prosperity, employment quality, social equity, visitor fulfillment, local control, community wellbeing, cultural richness and physical integrity” by United Nations Environment Programme (UNEP) and UNWTO (UNEP and UNWTO 2005, p. 12). As may be concluded from this document of UNEP and UNWTO, the environmental and social dimensions cannot be neglected to solely reach the economic aims. Because the main dimension which encapsules the other two is the environmental dimension. It may well be concluded that, so as to reach more sustainable economic goals, long term social and environmental aims should be taken into consideration.

Figure 1 demonstrates the main pillars or dimensions of sustainable tourism as environmental, social, and economic. The former dimension (environment) is at the heart of all the dimensions. Meaning that, if you primarily consider in your sustainable tourism plans and projects the environmental aims, then it means that you already will automatically include the socially and economically beneficial outputs in the long term and

**Sustainable Tourism
(Sustainable
Development of
Tourism, Sustainable
Tourism Management),**

Fig. 1 Main pillars of sustainable tourism: environmental, social, economic. (Figure designed by Sonuc, N.; the author of this article)

the tourism format is then accepted as sustainable. Explained further, the primary goal of sustainable tourism should be to protect environmental and social resources while putting plans into practice if sustainable social, environmental, and economical returns are desired.

Otherwise, if solely economic concerns are put forward and others are denied, then those forms of tourism practices will not be included inside the sustainable tourism perspective. Furthermore, they not only lose the economical benefits in the long term, but also deplete and destroy the environmental and social dimensions. The examples of sustainable forms of tourism according to their outcomes under the most representative three pillars are also shown in Fig. 1. The given three pillars inside the figure are not with solid borders; the borders are shown with dotted lines that let the flow in-between; as sustainable tourism forms are executed mostly multi- and intradimensionally.

According to the definitions of sustainable tourism management, the objectives defined can be a reason for confusion. Politically, the definitions and objectives may be realized and interpreted as too ideal. Thus, the real concrete implications in the industry may not match. As an example, the measurement of the impacts of tourism mentioned by the surpassed carrying capacities brings some of the threatening results and the destructive nature of the industry. Thus, it may be concluded that it is beyond the tourism industry's ability to comply with the highly demanding objectives of sustainability fully. That is why

some forms of the tourism sector are sustainable while others are not.

This means that all tourism types may not be sustainable even if they are committed to be managed sustainably. As may be understood from Fig. 2, sustainable management of tourism may be applied to all tourism types. It also shows the case of the tourism industry possessing both the sustainable and not sustainable parts of the supply.

It is understood from the figure that tourism practices inside the white dotted lines are sustainable, the parts outside are not sustainable tourism practices. Thus, it can be inferred that, wildlife tourism, nature-based tourism, natural-area tourism, and other tourism practices may exist in sustainable or unsustainable forms. Additionally, the only totally sustainable tourism type is seen as ecotourism which is shown with dark dotted lines. When the inside of this ecotourism circle is observed, it is discovered also that ecotourism is composed of the sustainable practices of nature-based and wildlife tourism.

Whilst, Fig. 2 may be a representative of the tourism sector, there may exist different boundaries to what is considered sustainable and what is not both in theory and in practice. Conceptualizations may vary according to the perspectives and localities. In the Encyclopedia of Ecotourism, for example, ecotourism has been categorized into softer or harder versions so as to conform more or less to the requirements of sustainability (Weaver 2001). So it is better not to expect global conceptualizations and clearly defined boundaries of the sustainable tourism practices but evaluate

Sustainable Tourism (Sustainable Development of Tourism, Sustainable Tourism Management), Fig. 2 The place of sustainable tourism in the tourism industry. (Adapted from Cater et al. 2015, p. xxii)

and try to understand specific cases with their own genuine local characteristics. Still, the need for creating the researches and studies for more scientific and acceptable conceptualizations are emphasized by many scientifics.

The Global Code of Ethics for Tourism is another important document to mention for sustainable tourism (Table 1). Adopted in 1999 by the General Assembly of the World Tourism Organization, its acknowledgment by the United Nations 2 years later expressly encouraged UNWTO to promote the effective follow-up of its provisions.

When all these ten articles of the Global Code of Ethics for Tourism are considered each in its own perspective, they include the principles of sustainability at social, economic, and/or environmental aspects.

Conceptual Clarification of the Sustainability and Tourism Relationship

Changing views have existed about sustainable tourism’s diverse pillars, its framework, and its practicability. During the concept’s evolution, its

Sustainable Tourism (Sustainable Development of Tourism, Sustainable Tourism Management), Table 1 Global Code of Ethics for Tourism (UNWTO)

Article 1: Tourism’s contribution to mutual understanding and respect between peoples and societies
Article 2: Tourism as a vehicle for individual and collective fulfillment
Article 3: Tourism, a factor of sustainable development
Article 4: Tourism, a user of the cultural heritage of mankind and contributor to its enhancement
Article 5: Tourism, a beneficial activity for host countries and communities
Article 6: Obligations of stakeholders in tourism development
Article 7: Right to tourism
Article 8: Liberty of tourist movements
Article 9: Rights of the workers and entrepreneurs in the tourism industry
Article 10: Implementation of the principles of the Global Code of Ethics for Tourism

Adapted from <http://ethics.unwto.org/en/content/global-code-ethics-tourism>

understanding and perception have continued to develop. The environmental dimension was at the forefront. Then, the economic and social

dimensions followed. None of the dimensions are to be neglected. In fact, as tourism itself is already multidimensional, multifaceted, and complex in nature, so is sustainable tourism and the evolution of its understanding.

Hardy et al. (2002, pp. 489–490) have shown the paces of this evolutionary period of sustainable tourism. In their study, “conservation,” “community,” and “economic” visions corresponded to the three dimensions of sustainable tourism being environment, social, and economic dimensions. Evolution of conceptualization of the sustainable tourism over time, at least until the time period this study was created, including academic and industry response correspondingly, becomes more clearly understood. The significance of some of the important terms and steps concerning sustainable tourism can be summarized as follows: Doxey’s (1975) Irridex Model suggested that as the stages of the tourism evolve, the resident’s perceptions change from “euphoria” to “apathy” then to “irritation” and finally to “antagonism.” Butler’s (1980) Life Cycle Model tried to describe the stages of a touristic area as “exploration,” “involvement,” “development,” “consolidation,” “stagnation,” and finally “rejuvenation” or “decline.” Both models have been subject to many other researches and implications as well as criticisms in the framework of the sustainability of the tourism industry. Additionally, the attempts of some international nongovernmental organizations such as IUCN and WWF are mentioned in the evolution of the sustainable tourism concerns.

IUCN (The International Union for Conservation of Nature) has evolved into the “world’s largest and most diverse environmental network” since it was created in 1948. IUCN included among its members public, private, and nongovernmental organizations and working with six commissions dedicated to species survival, environmental law, protected areas, social and economic policy, ecosystem management, and education and communication (IUCN).

WWF was founded as the World Wildlife Fund in 1961, later in 1986 named “World Wide Fund for Nature” as more suitable to its actions and since then using the acronym WWF is used in

order to avoid confusion. WWF works for realizing its mission to “stop the degradation of our planet’s natural environment, and build a future in which humans live in harmony with nature.” In order to realize these objectives WWF focus on two key issues: first, keeping the biodiversity of the World (critical places and species) and the second, reducing the ecological footprint which is the negative impact of human activity; by working to ensure that the natural resources required for life – land, water, air – are managed sustainably and equitably (WWF). Many other local, national, and international nongovernmental organizations alike exist with the aim of protecting the environment.

Another urge for conceptual clarification about sustainable tourism was made by Saarinen (2014). Saarinen brings a critical commentary on sustainable tourism by explaining and discussing the multiple efforts of defining the conceptual framework of sustainable tourism both on the theoretical and practical fields. Additionally in this study, the need for setting frameworks for setting the limits to growth and responsibility in tourism is precised. The writer also lists on the table below the traditions of sustainable tourism and setting the limits to growth accordingly (Table 2). This table helps understand the content of the sustainable tourism traditions.

As shown in the table, three traditions of sustainable tourism are mentioned as “resource-based,” “activity-based,” and “community-based” corresponding to basic three “environmental, economic, and social” dimensions of sustainable tourism. Each appears listed with their own character of origin/manifestation, orientation, limits to growth, resource and system view, and timescale.

Current Issues About Sustainability of Tourism

During the following years, the evolution of sustainable tourism continued to grow. The dimensions’ and the stakeholders’ separation stage was inevitably followed by the unification stage. It is concluded that trying to understand and solve the

Sustainable Tourism (Sustainable Development of Tourism, Sustainable Tourism Management), Table 2 Traditions of sustainable tourism and setting the limits to growth

	Resource-based	Activity-based	Community-based
Origin/manifestation	Carrying capacity model	Product cycle (TALC)	Participatory planning
Orientation	Environment (physical)	Industry	Community
Limits to growth	Objective/measurable	Relative/changing	Constructed/negotiated
Resource and system view	Static	Dynamic	Dynamic/static
Time scale	Long	Now	Short

Adapted from Saarinen (2014, p. 4)

problems concerned with each different party separately would not work. The complexity of the industry of tourism also included the complexity of the stakeholders. However, the resolving of the problems lay under a simplicity of a holistic view. That is, bringing all the parties involved into question for the resolution of the problems. The sustainable management of tourism thus requires a management style involving all the concerned parties into all processes of sustainable tourism, especially taking part in the decision-making. Regarding this issue, many reasonings and suggestions are made by researchers.

The sustainability is considered on the theoretical part while the responsibility is considered on the practical side in one suggestion on the basis of the sustainable management of tourism on the more macrolevel of destination rather than the microbusiness level (Mihalic 2016). Higgins-Desbiolles (2018) criticizes the tourism industry's unsustainable practices which are against the sustainability of tourism and which support the growth of tourism despite its devastating results not only to the environment but also the culture of the population. It is further emphasized in this study that the distinction between economic growth and sustainable development of tourism is to be made; plus as indicated since the Brundlandt Report, the clear understanding and implication of the sustainability requirements are to be realized.

In fact, the problem of not being able to implement sustainable tourism on the practical level raises the question: Is sustainable tourism the only solution to the current problems such as overtourism, commodification, overbuilding, air pollution, water pollution, climate change and so on, or is there a need for different management

styles? As seen in the evolutionary phases of sustainable tourism, there has always been avoidance about its application either because of its too unrealizable and unreachable structures or its costly investment and frighteningly long term planning considerations. It has always been perceived by the practitioners to be not responding to their short-term, profit-based, macro- and micro-economic objectives. But humankind has always found itself constantly re-defining the same long-term objectives for saving this one World which is their only place of inhabitation. That is why, the most recent updates for sustainable development as well as sustainable tourism re-tell in other words the same objectives. The "17 SDGs (Sustainable Development Goals) with 169 associated targets" which are "integrated and indivisible" joining together "the world leaders with common action" and "across such a broad and universal policy agenda" (UN Resolution 2015, p. 18/6) was adopted by the UN Member States in 2015 as the 2030 Agenda for Sustainable Development. The 17 SDGs are shortly named as: "no poverty," "zero hunger," "good health and well-being," "quality education," "gender equality," "clean water and sanitation," "affordable and clean energy," "decent work and economic growth," "industry, innovation and infrastructure," "reduced inequalities," "sustainable cities and communities," "responsible consumption and production," "climate action," "life below water," "life on land," "peace, justice, and strong institutions," "partnerships for the goals" (UN Sustainable Development Goals Knowledge Platform).

The UNWTO also launched "Tourism4SDGs.org" as an online platform in order to realize the linkage between the 17 SDGs and tourism. It is

emphasized by the UNWTO that the 17 Sustainable Development Goals (SDGs) constitute an ambitious global agenda for people, planet, prosperity, and peace through partnerships. The SDGs aim to end poverty, fight inequality, and injustice and to solve the problems engendering the climate change by 2030. The economic relevance of tourism, representing up to 10% of the world's GDP and employment, makes harnessing its full potential essential for the advancement of the SDGs (UNWTO Tourism for SDGs Platform).

Recent publications exist about the theoretical and practical aspects of the adaptation of tourism businesses to the SDGs (Hall 2019; Higham and Miller 2018; Bramwell et al. 2017; Kristjánsdóttir et al. 2018; Gössling and Hall 2019; Hughes and Scheyvens 2016; Boluk et al. 2017; Cotterell et al. 2019; Harilal et al. 2018; Scheyvens and Biddulph 2018). Most of the researches point out that it is not possible for the tourism industry to fully engage in and realize all the 17 SDGs. The businesses choose among the SDGs the aims that are more in line with their own business objectives and try to apply them by using the CSR (Corporate Social Responsibility) mechanisms (Jones et al. 2017; Hall 2019; Hughes and Scheyvens 2016). As indicated by Hughes and Scheyvens (2016, p. 478): "While it is pleasing to see many hotels and others applying ethical principles to their business practices, typically under the banner of CSR, the reality is that for many in the industry CSR is limited to either PR exercises, cost-saving (e.g., energy efficiency) or tokenistic sideline activities, often with direct and positive spin-offs for the company." Time will show how tourism industry will adopt and adapt to the 17 SDGs. Recent case studies exist about local and regional examples of adaptation to SDGs (Su et al. 2017; Kimbu and Tichaawa 2018; Islama and Shamsuddohab 2018; Tracey et al. 2017).

Sustainable Tourism Products and Policies

Nil Sonuç

İzmir Katip Çelebi University, İzmir, Turkey

Definition and Conceptual Framework

Under the title, “Sustainable tourism products and policies,” one of the important pillars of sustainable tourism, the economic pillar of sustainable tourism shall be dealt with. As it may be predicted, the “policy” is representing the “macro” and the “product” the “micro” level on the planning and operational management of sustainable tourism. On the pathway to realize more sustainability in tourism policy and planning, theoreticians and practitioners affirm involvement of all parties toward more participatory patterns and/or structures. The

economic aim of this flexible, ever-evolving, and multidimensionally participative pattern which encourages cooperation and collaboration is to distribute fairly the benefits of sustainable tourism to the stakeholders.

UNWTO (United Nations World Tourism Organization) is the leading authority continuously working to develop this philosophy and the practicability of this pattern. UN (United Nations) members accepted Agenda 2030 for Sustainable Development “Transforming Our World” in 2015. This agenda is a developed version of the historic “Millennium Development Goals” with newly updated 17 SDGs (Sustainable Development Goals) with their 169 associated targets. The agenda sets out a global framework “to end extreme poverty, fight inequality and injustice, and fix climate change” until 2030 with a “people-centered, transformative, universal and integrated” perspective (UNWTO Web Site). UNWTO organizes many conferences, meetings, and other activities to increase the theoretical and practical implicability of these SDGs by the tourism sector. Tourism for SDGs (tourism4sdgs.org) is a platform created to help tourism professionals adopt this development process.

You can refer to the “sustainable tourism” article in this encyclopedia for the general understanding of this term. Sustainable tourism in its own nature is a newly studied and developing field in theory, philosophy, and implications. And its sub-components can be understood more clearly with specific case studies. Thus, the basic components of the sustainable tourism policy and product are going to be described by the specific case studies and examples from the literature.

Saarinen (2006) critically discussed the resource-, activity-, and community-based traditions of sustainability in relation with the contexts of implicability of sustainable tourism at local or global levels as well as limits to growth and the carrying capacities. Additionally, in the critical analysis of the theory about the sustainable development and its derivative, sustainable tourism is made in this study which proves that it is necessary to understand the essence of these issues thoroughly for policy making in tourism.

Stakeholder Involvement for Sustainable Tourism Products and Policies

Simpson (2001, p. 33) argued that “sustainable tourism development, stakeholder participation, and strategic orientation offer considerable synergistic benefits which could be profitably incorporated into any policy and process related to long-term tourism development ambitions.” Even at the destination level, more destinations are claimed to adopt strategic, sustainable perspectives toward tourism development (Ritchie and Crouch 2000), and the importance of strategic planning and community involvement is emphasized (Simpson 2001; Ruhanen 2004). However, the result of the studies examining local destinations on these issues proved that local implications lack these aspects. Local tourism destinations in Australia, for example, were found to be reactive rather than proactive with superfluous plans and day-to-day decisions (Ruhanen 2004).

It is not easy to define a stakeholder involvement framework that will be valid for all destinations in sustainable tourism policy implication and product creation. However, case studies developed to handle the matter exist. Byrd (2007) discussed the different aspects of the stakeholder participation basically on two pillars: who to include and the extent of inclusion in decision-making and benefit sharing. In this context, the roles and the interests of the stakeholders, the incorporation of multiple stakeholders, the involvement and inclusion of the participants in decision-making, and so on were discussed exemplifying the different scenarios from the literature of sustainable tourism. Among the involved stakeholders, business owners, residents, local officials, and potential business owners, DMOs, present and future host communities, and current and future visitors were mentioned according to the case studied.

As indicated by Donaldson and Preston (1995), it is important to understand and identify all the interests, while equal involvement of all stakeholders in the decision-making process is not

required. Another study in İzmir, Turkey, shows a stakeholder framework proposal for social tourism including all stakeholders as government bodies in collaboration with the private sector, NGOs, consultants, and people at both ends of user and beneficiary at different layers of decision-making, supply and demand, and product (Sonuç and Oral 2017, pp. 48, 49).

A MSIM (multi-stakeholder involvement management) framework was developed with three strategic levels “attraction, integration and management of stakeholder involvement” embedded within six stages “scene-setting, recognition of stakeholder involvement capacity, stakeholder relationship management, pursuit of achievable objectives, influencing implementation capacity and monitoring stakeholder involvement” at a case study based in the UK (Waligo et al. 2013).

Hardy and Pearson (2018) probed the perceptions of different stakeholder groups that included “locals, operators, community members and the regulatory positions,” and they noted that the contextual views belonging to different groups were clearly defined. In addition, it is confirmed that variations in attitudes toward sustainable tourism development may arise according to the regional differences and the sociopolitical context of the region under examination. Thus, it is suggested that stakeholder research be an “ongoing” and “contextual process,” to guarantee that “decision-making related to tourism” is as “responsive” and “reflexive” as possible.

Integrated Approach Prioritizing Local Livelihoods for Sustainable Tourism Products and Policies

In a study substantiating the sustainability’s positive impact on destination’s competitiveness, as a result of the PCA (Principal Component Analysis) of “Small Destinations of Excellence” in Italy, the basic indicators of the “sustainable tourism policy and destination management” component were found as “the integrated approach to tourism planning,” “the collaboration and the community participatory process,” “the stewardship of the natural environment,” “the monitoring and

minimizing of the negative tourism impacts,” and “the public commitment to tourism and to tourism education.” And the importance of the tourism education for all the participants was underlined in order to create a more sustainable tourism policy with the knowledgeable collaborative participants (Cucculelli and Goffi 2016).

Understanding the livelihood structure of a region is important before making tourism a part of the life of the people living there as this may bring benefits as well as risks. Tao and Wall (2009) show and defend their findings from their study that livelihood perspective enables understanding of the social and economic structure in a specific geographical and political area with its own dynamics more tangibly. Moreover, this makes the sustainability of tourism policies and implications more realistic, avoiding the risks and making it economically more viable for the locals.

Moving from the need for tourism planning based on multidimensional sustainability objectives, Blancas et al. (2011) proposed a sustainable development indicator system which enables the most objective results possible by including the economic, social, and environmental dimensions as well as destination benchmarking and the maximization of the strengths and opportunities and minimization of the weaknesses and threats. If the economic indicators of sustainable tourism in this study are to be exemplified, the first is “economic benefits of tourism for host community and destination.” Its subindicators are shown as unemployment rate, number of tourist arrivals, registered service sector investment volume, and net income per habitant. Other related economic issues of sustainability are indicated as:

- “Sustaining tourist satisfaction” (indicators: tourist satisfaction level, price-quality relationship, percentage of return visitors, satisfaction level of visits to protected areas)
- “Development control” (indicator: land use planning)
- “Tourist offer” or “variety of experiences” (indicators: vacancies offered in accommodation and restaurant establishments, tourist information offices per tourist, existence of a destination website, ecotourism services)

“Tourism activity seasonality,” “tourism employment,” “transport related to tourism,” “destination competitiveness,” “creation of tourist itinerary and routes,” and “infrastructure” are also mentioned among other important economic indicators of sustainable tourism.

Sustainable tourism’s local economic contribution is subjected to studies that emphasize the importance to understand the local and regional political and economic structures. In Africa, Simpson (2009) studied the local economic contribution to sustainable livelihoods and found out that only those few people employed directly in tourism were positively affected but the reason for other conflicting impacts engendering from which sector is not clearly understood because of the limitations of the methodology. Reid and Schwab (2006) examined the ecotourism and heritage tourism implications in Jordan from the sustainability aspect, and they also reached to the conclusion that local dynamics are important to be understood while the policy and product structures are formulated for sustainable tourism.

Recent studies become more case specific and have local findings that may be leading for the local sustainable tourism policy and product development. In China (Gao and Wu 2017) and Iran (Ghaderi and Henderson 2012), case studies of rural tourism were conducted to explore the impact of sustainable tourism. In Iran, the results show that rural tourism is only a supplementary source of income for some of the inhabitants and criticized by the people who did not benefit from it. In China, a more participative model was suggested which showed a more succeeded rural sustainable tourism practice. It elaborated priority at social and spiritual levels for stakeholders rather than economic at an engagement level of more protectionist and possessive philosophy. When compared with the Iranian example which seems to give priority to the economic aims of increasing income, China’s example proves to be a sustainable model.

In Mexico (Avila-Foucat and Rodríguez-Robayo 2018) and India (Apine et al. 2019), the nature-based environmental sustainable tourism policy and product diversification for increasing and improving livelihood opportunities are dealt

with. In both cases, in a framework of diversification for the livelihoods, the involvement and coordination of the communities at the governmental and nongovernmental level, the necessary knowledge and information formation, and thus the need for education of all parties for the sustainability and understanding of the local and regional dynamics are viewed as important issues.

A study in the Caribbean focused on the issues hindering the sustainability of tourism such as stakeholder participation, and the academics and practitioners are called for collaboration toward forming the sustainable tourism policies (Harrison et al. 2003).

A study of the sustainable development of tourism in Guadeloupe (Sonuç 2003, 2009) made some product and policy suggestions so as to increase the compliance with sustainable tourism such as diversification of the tourism product, inclusion of all related stakeholders, preservation of nature, and protection of the cultural resources and using them sustainably for creating more sustainable tourism products. A schema of the products was suggested for the categorization of products which is a useful tool to indicate where each product stands before taking action to make them more sustainable (Fig. 1).

As a result of the need for more reliable sustainability indicators and measurement, studies of benchmarking of sustainability among the regions also emerge. A study conducted by Cernat and Gourdon (2012) shows the case of benchmarking sustainable tourism across countries. The three developing countries of Asia (Indonesia, Malaysia, and Thailand) which provided more available data are benchmarked with the help of STBT (sustainable tourism benchmarking tool), a quantitative tool of seven sustainability dimensions (tourism assets, tourism activity, tourism-related linkages, tourism-related leakages, environmental and social sustainability, overall infrastructure, attractiveness), and their subindicators.

As a result, it can be concluded that the economic implications of sustainable tourism cannot be considered separate from the local livelihoods. Thus the environmental social and economic pillars are measured and implied inseparably in the planning, policy, and product implications of

Sustainable Tourism Products and Policies, Fig. 1 Schema of tourism products positioning in Guadeloupe. 1. Package tour (mass tourism) (St. Domingue, Cuba), 2. VFR, 3. Timeshare, 4. Holiday village, 5. Four-star luxury hotels, casinos, and shopping, 6.

Luxurious products and technologically modern hotels for business tourism (Grande Terre, St. Martin, St. Barth, Martinique), 7. Cruise tourism, 8. Ecotouristic products, 9. Renting from the owner (Gite, meuble), 10. Social tourism. (Adapted from Sonuç 2003, p. XXV)

sustainable tourism. Mainly the stakeholders, the local livelihoods, the tourist satisfaction, and the sustainable development requirements such as the global climate change, welfare and well-being of the locals, and natural and cultural heritage conservation are the subjects that are dealt with by the academic works. More researches are called for by academics to be in collaboration with practitioners in order to have more implicable results pragmatically and tangibly appreciated and letting a more local, regional, and global reciprocity as well as comparability.

The Concept of Sustainable Transition

In this entry, the conceptualization of sustainability transitions is adopted from Markard et al. (2012) who define sustainable transition as follows:

Sustainability transitions are long-term, multi-dimensional, and fundamental transformation processes through which established socio-technical systems evolve into more sustainable versions of production and consumption.

In this respect, this entry treats the terms “sustainable transition” and “sustainability transitions” interchangeably to describe these fundamental transformation processes toward a greater degree of sustainability. In general, research on sustainability transitions scrutinizes changes in societal subsystems, such as energy or transport, by emphasizing the social, technological, and institutional interactions (Loorbach et al. 2017). Transitions are seen to involve a broad range of actors and typically take place over considerable time-spans, such as 50 years and more (Markard et al. 2012).

Introduction

Scholarly literature has witnessed the increasing outbreak of various and serious threats to

sustainability (e.g., Geels 2011; Köhler et al. 2019). For example, Rockström et al. (2009) stressed that exceeding the planetary boundaries of the global Earth system is due to human activities. To this end, achieving sustainable development requires rapid and profound transformations throughout all societies and its sectors, including realms of energy, water, food, and transport (Brown et al. 2013; Geels 2012; Kahiluoto et al. 2014; Shaw et al. 2014; Levänen et al. 2020).

In the turn of the millennium, streams of research that revolved around sustainability-oriented innovations and technologies gained increasing attention (Markard et al. 2012). Eventually, this led to the emergence of the research field referred today as “sustainability transitions” (Markard et al. 2012). According to Köhler et al. (2019), the aim of addressing the persistent unsustainability the global system is confronted with is the very essence of research focusing on sustainable transition.

The concepts of socio-technical regimes and niches, elaborated by Nelson and Winter (1982), are central for sustainable transition. The study on technological regimes set the development trajectory for the notion of socio-technical regime applied in the extant transition research. To this end, in the late 1990s Rip and Kemp (1998) scrutinized regime shifts and the elements preluding the destabilization of established regimes leading in the evolution of new regimes. Zooming closer, the contemporary transition literature assumes transitions constituting from regime shifts.

The transition literature assumes regimes being endogenously fixed on incremental socio-technical change as well as rigid trajectories of development (Geels and Schot 2007; Rip and Kemp 1998). Sustainability transitions draws from the vested notion the existing regime manifesting power that provokes incumbents to develop strong positions against pioneers, who typically are the initiators of sustainable alternatives (Geels 2011). Kemp et al. (1998) conceptualize socio-technical niches as protected spaces, for example, specific markets in which radical innovations are able to flourish without being introduced to the selection pressure of the prevailing regime during an early phase of a

transition. Niche innovations can acquire momentum, and thus, become capable of challenging and competing with the prevailing regime via social learning through various experiments, articulating promising expectations and heterogeneous networking (Geels and Raven 2006).

The extant literature on sustainability transitions depicts in four prominent frameworks: (1) Transition Management, (2) Strategic Niche Management, (3) Technological Innovation System, and (4) the Multilevel Perspective.

The next section discusses the dominating frameworks of sustainability transitions. After addressing the conceptual background of the entry, the entry presents how research on sustainable transition is currently applied and what are the emerging developments in the field.

Dominating Frameworks

Transition Management

Transition management (TM) is proposed as a novel means to govern sustainable development. The framework draws from complex systems theory and new forms of governance that are incorporated to a novel governance approach (Loorbach 2010; Kauffman 1995; Rotmans et al. 2001). According to Rotmans et al. (2001), the approach is targeted to reconstruct socio-technical systems toward a greater degree of sustainability. In transition management is assumed that the boundary conditions of both the sociotechnical system and sectoral policy regimes require structural change in order to shift toward sustainability (Kern and Howlett 2009). In this respect, policy developments are required to bring forth these changes (Kern and Howlett 2009).

Voß et al. (2009) stressed transition management merging an orientation toward a long-term vision of sustainable development accompanied with short-term experimental learning to seek alternatives and trajectories for accomplishing the vision. To this end, scholars stress that the leading notion of transition management is to promote transitions by gathering various actors together to build new visions and trajectories for change (Hyysalo et al. 2019; Köhler et al. 2019).

Strategic Niche Management

In the late 1990s, Kemp et al. (1998) elaborated the framework of strategic niche management (SNM). The notion of the strategic niche management is to manage innovations – which are seen as socially desirable and serve long-term goals, such as sustainability – and path-breaking novelties that are not compatible with the existing infrastructures, user practices, or regulations. Strategic niche management builds on the assumption that niches are spaces that orchestrate temporary protection for the configuration and evolution of path-breaking innovations (Kemp et al. 1998; Schot et al. 1994). In this respect, strategic niche management can be perceived as the purposeful creation and support of niches that eventually establish regime shifts (Hoogma et al. 2002; Kemp et al. 1998).

The need of protection and nurturing in the early stages of a transition is explained by the premise that the regime shaping innovations are not able to survive in the selection environment and pressures of the prevailing socio-technical regime. The protection may cover, for example, subsidies or tax incentives. According to Smith and Raven (2012), with such protection, the path-breaking innovations are anticipated to evolve and enter broader and more diverse markets. To this end, the dependence on protection progressively lessens as the niches grow competitive and begin to enable regime shifts. The strategic niche management is targeted at bringing the knowledge and expertise of various actors into the course of technological development, and nurture bilateral learning and institutional adaptation (Kemp et al. 1998). This reciprocity between actors and institutions in a certain technological field is a fundamental notion in the strategic niche management studies (Kemp et al. 1998; Konrad et al. 2012).

Technological Innovation System

Sustainability transitions typically provide a setting for the framework of technological innovation system (TIS) (Markard et al. 2016). The notion of the technological innovation system is to embark on the emergence of new technologies and the institutional and organizational changes happening concurrently with technological

development (Markard et al. 2012). According to Markard et al. (2016) studies on technological innovation system aim at understanding the dynamics of an innovation system that is centered around a certain technology. The technological innovation system approach was initially discussed by Carlsson and Stankiewicz (1991). They build on the notion that the generation, diffusion, and application of a technological innovation is initiated by the systemic interplay of organizations and other actors in a certain institutional setting.

It is distinctive for the technological innovation system to emphasize interdependencies in the system. Taking a closer look, a focus on interdependencies builds various means of cooperation, for example, collective resources on which different actors can draw but would be unable to produce if they acted without such a collaboration (Bergek et al. 2015). The framework is considered as means to evaluate the performance of a technological innovation system. The technological innovation system is targeted to recognize drawbacks, and gather recommendations for governance in favor of a certain technology and, thus, a sustainability transition (Alkemade et al. 2011; Weber and Rohracher 2012; Wieczorek and Hekkert 2012; Jacobsson and Karltorp 2013).

Multilevel Perspective

Multilevel perspective (MLP) on socio-technical transitions may be the most prominent framework in the sustainability transition literature (Köhler et al. 2019). One explaining factor for this prominence is the fact that the MLP perceives transitions as a bid to bridge technological and social aspects in explaining sustainability changes. Verbong and Geels (2010) note that the objective of the MLP is to conceptualize the dynamics of a transition by concentrating on socio-technical systems via noticing the co-evolution and the influence of actors.

The MLP divides transitions to sustainability to three levels: niche, socio-technical regime, and exogenous socio-technical landscape (Geels 2002; Rip and Kemp 1998). The MLP draws from the assumption transitions stemming from the alignment of trajectories and continuous

processes in and between these three levels (Geels 2002; Geels and Schot 2007). The dynamics between the three levels are often condensed along these lines: First, niche innovations progressively amplify their leverage within the niche level (Geels 2002, 2010). Second, developments at the landscape level create growing pressure on the regime (Geels 2002; Geels and Schot 2007). Third, the destabilization of the regime opens windows of opportunity for the niche innovations to diffuse, which simultaneously with continuous regime processes establish major transformation and disruption (Rip and Kemp 1998; Geels 2002). Scholars stress the objective of burgeoning sustainability transitions being the confrontation, shaping, and reestablishing the existing, unsustainable, system (Geels 2011; Geels and Schot 2007).

Current State of the Art in the Sustainability Transition Research

The sustainability transition research has diversified significantly from the early years of the field. Based on the recent developments in the field, transition studies are beginning to broaden their scope. Taking a closer look, contemporary sustainability transition research has witnessed scientific openings that explore interactions between multiple existing – and possibly either competing or cooperating – niches and the implications these various interactions provide for the larger system (Markard and Hoffmann 2016; Raven 2007; Verbong et al. 2008; Papachristos et al. 2013; Sandén and Hillman 2011; Köhler et al. 2019).

The destabilization, decline, and phase-out of current systems and regimes are suggested as important topics in the extant research on sustainable transition (Karlton and Sandén 2012; Kuokkanen et al. 2018; Kungl and Geels 2018; Roberts 2017). These are seen to constitute the other side of transition (Köhler et al. 2019). Transition literature acknowledges that established systems can be shaped or replaced due to niche level pressure. In addition to this notion, recent studies have started to pay attention to system's intentional phasing-out, since purposeful phasing-out may provide more room and power

for niche innovations (Rogge and Johnstone 2017; Stegmaier et al. 2014; Köhler et al. 2019).

Another growing research topic in the transition studies is the breakthrough, diffusion, and tipping points of a transition. This emerging topic is explained due to various advances in the real world. Köhler et al. (2019) have noted some technological fields, such as electric vehicle domain, reacting rapidly on the sustainability threats, and thus, enabling sustainability transitions.

Moreover, recent academic insights are often targeted to provide a broader perception on sustainability transitions (Köhler et al. 2019). Succeeding in this attempt calls for interactions between multiple systems such as electricity-transport, agriculture-transport, and heat-electricity (Konrad et al. 2008; Papachristos et al. 2013). Schot (2016) has noted that research on “deep transitions” is gaining increasing attention in the field. The objective of deep transitions is to focus on macro level and investigate how multiple regime shifts can shape landscape developments, and thus, societies as a whole (Schot 2016).

The question if sustainability transitions need to take decades to succeed is another important topic in the transition literature (Köhler et al. 2019). In other words, speed of transitions and how transitions can be accelerated are rising topics in the present transition research (Sovacool 2016; Bento and Wilson 2016).

In general, the field of sustainability transitions has experienced a rapid growth during the past two decades. Markard et al. (2012) have argued despite this growth, research on sustainability transition can still be considered as a rather narrow field: it has gained ground in selected innovation and policy journals, but the prominence in the established journals on management studies, economics, economic geography, and political science remains rather scant.

Emerging Themes in the Sustainability Transition Research

Köhler et al. (2019) have proposed that in the near future the transition research will pay increasing

attention to five different themes. First theme considers the preciseness of the sustainability transition under examination; are the cases exploring in-depth single cases or developing a generic insight from a transition (Köhler et al. 2019)? Second growing theme in the transition research is proposed to consider the time span of transition. The transition research is expected to adopt narrative approaches to explain both historical and contemporary transitions (Köhler et al. 2019). The third emerging theme pays attention to the levels of analysis. The sustainability transition research is anticipated to unite the study of micro level processes to the macro level system configuration study. At the moment, scholars are calling for contributions vis-à-vis the interdependences of micro and macro levels (Köhler et al. 2019). The fourth suggested increasing theme in transition research focuses on balancing between reduction and articulation in the complex nature of a transition. The future studies thus call for the embrace of irreducible complexity, such as modeling approaches and indicator development (Köhler et al. 2019). The final proposed theme considers the perceived distanced research from real-world experimentation and action research. In order to gain societal relevance, sustainability transition research is expected to adopt more methodological pluralism and action research (Köhler et al. 2019).

Moreover, several authors have argued that one of the largest debates in the sustainability transition research concerns the question if agency is sufficiently embedded in the literature or not (Avelino and Wittmayer 2016; Bakker 2014; de Haan and Rotmans 2018; Fischer and Newig 2016; Gazheli et al. 2015; Pesch 2015; Sarrica et al. 2016; Upham et al. 2015, 2018; van der Vleuten 2018). Some scholars argue that actors are always embedded in the core frameworks of sustainability transitions (e.g., Kemp et al. 1998; Geels 2011; Bergek et al. 2015). However, many scholars have also noted that the diversity of actors is not sufficiently addressed in sustainability transitions literature (e.g., de Haan and Rotmans 2018; Avelino and Wittmayer 2016; Fischer and Newig 2016). For example, knowledge on actors appears to be often scattered and many psychosocial processes of actors remain

under-researched (Bögel and Upham 2018; Gazheli et al. 2015; Pesch 2015; Upham et al. 2018). Since this debate appears quite heated in the transition community (van der Vleuten 2018), it is anticipated that the research on actors in sustainability transitions continues to increase within the field of sustainability transitions.

Sustainability transition studies have experienced a significant growth and diversification compared to the early publications in the turn of the millennium. In general, it is expected that the sustainability transition literature continues to incorporate established disciplines such as development studies, political sciences, business studies, and science and technology studies in order to achieve thriving sustainability transitions. While the earth system suffers from various sustainability challenges, the need for sustainability transitions is still evident. Hence, the core frameworks of sustainability transitions are still relevant in achieving sustainability.

Summary

Sustainable transitions are described as fundamental transformation processes toward a greater degree of sustainability. The discipline field of sustainability transitions began to emerge in the turn of the millennium. The aim of sustainability transitions is to address the persistent unsustainability the global system is confronted with. Transitions emerge through regime-shifts. Regime-shifts constitute from fundamental changes throughout the entire societal level. Sustainability transition literature focuses often on societal subsystems, such as energy or transport, by emphasizing the social, technological, and institutional interactions. Transitions involve various actors and take place over considerable time-spans, such as, 50 years. The sustainability transition research has diversified from the early years of the field, and this development trajectory is anticipated to continue in the future as well.

Synonyms

Green vehicles; Sustainable mobility

Definition

Sustainable transportation is any action of transporting someone or something that adheres to commonly accepted sustainability criteria.

History

Being the major driving force behind growing world demand for energy, the role of transport in sustainable development was first recognized at the 1992 United Nation's Earth Summit and reinforced in its outcome document – Agenda 21.

The 2002 World Summit on Sustainable Development offered a first cornerstone for the operationalization of sustainable transportation through the Johannesburg Plan of Implementation (JPOI), which covered infrastructure, public transport

systems, goods delivery networks, affordability, efficiency and convenience of transportation, as well as improving urban air quality and health, and reducing greenhouse gas emissions.

In 2012, the United Nations Conference on Sustainable Development (Rio+20) highlighted that sustainable transportation should pursue the enhancement of economic growth and the improvement of accessibility, allowing for a more inclusive and integrated economy within social and environmental constraints. This clarified that sustainable transportation has a central role in improving social equity, citizens' health, urban resilience, and the productivity of rural areas.

In 2014, the High-Level Advisory Group on Sustainable Transport (HLAG-ST) compared all modes of transport, including road, rail, aviation, marine, ferry, and urban public transport providers. The resulting policy recommendations gained worldwide consideration due to the publication of a global sustainable transport outlook report entitled "Mobilizing Sustainable Transport for Development," released at the first Global Sustainable Transport Conference in November 2016. Only 1 year before, in 2015, investments in greening the transport sector emerged as a fundamental cornerstone for the achievement of the Paris Agreement goals within the United Nations Framework Convention on Climate Change (UNFCCC).

Finally, in the 2030 Agenda for Sustainable Development, sustainable transport has been identified as a key cross-cutting issue that arises from several Sustainable Development Goals (SDGs) (see ► ["Sustainable Development Goals"](#)) and targets related to food security, health, energy, economic growth, infrastructure, cities, and other human settlements.

General Principles and Metrics

Since pursuing sustainable transportation is a matter of resource efficiency in the creation of social-economic welfare, the general principles that may lead to a reduction of natural, social, and economic impacts are as follows:

- Don't transport the unnecessary
- Don't use inefficient transport modes when renewable and efficient transport modes are available
- Don't create new transport when sharing options are available

In detail, from an ecological perspective, sustainable transportation is a form of transportation that does not endanger public health or ecosystems and that meets needs for access consistent with, on the one hand, the use of renewable resources that are below their rates of regeneration and, on the other hand, the use of nonrenewable resources below the rates of development of renewable substitutes (OECD 2001).

Unfortunately, the heterogeneity of stakeholders' concerns makes it harder to formulate a deterministic definition of sustainable transportation from economic and social perspectives. The integration into the ecological perspective of a multiperspective and nonreductionist assessment of economic and social impacts on targeted stakeholders is thus a typical, but not the sole, way to account for the broader contribution of transportation to sustainable development.

In the context of lacking universally agreed thresholds of performance to be considered as sustainable (Neumayer 2003; Haghshenas and Vaziri 2012), transport systems are usually subject to policies that set targets referred to as benchmarks. These benchmarks tend to comply with such validity criteria as being easily understandable, reasonable, measurable, possible to quantify, accessible, comprehensive, reflecting various aspect of study, sensitive to changes over time, independent, standardized for comparison, clearly defined, and capable of capturing long-term processes (Nourry 2008). As an example, the European Commission Expert Group on Transport and Environment in 2000 set targets of environmental performance for 2020 as percentages of reduction of absolute emissions of carbon dioxide, volatile organic compounds, nitrous oxides, particulates, noise, and land use from a conventional baseline given by the same parameters measured in 1990.

Simplified operationalizations of the concept of sustainability in transport systems are justified

by the practical need to navigate the differential levels of importance that stakeholders attribute to incommensurable dimensions of sustainability and, thus, to refer to a small number of proxies of general interest. In doing that, absolute measures (e.g., total sectoral emissions), when compared to relative measures (e.g., emissions per kilometer per vehicle), are generally considered better able to investigate strong sustainability because they can better account for the worldwide increasing access to transportation, which is likely to negate the increasing efficiency of specific technologies (Janic 2006).

In this framework, sustainability assessment of transport systems can privilege by design different perspectives that refer either to the local or global intended audience. The local audience is expected to value most context-specific information about economic, social, and environmental performance that determine positive or negative subjective reactions to externalities on local communities. The global audience, instead, is expected to value most objective, noncontext dependent, variations of universally relevant proxies, which typically refer to physical (i.e., environmental) dimensions of global impact categories. Hybrid approaches, consisting of both absolute and relative yet widely applicable indicators such as multimodal accessibility, land consumption for transport infrastructure, population exposed to noise >55 dB (A), total time spent in traffic, traffic fatalities, and injuries per capita are considered acceptable for comparing the sustainability of transport systems in different urban areas (Corsini et al. 2016; Haghshenas and Vaziri 2012).

The choice of metrics might influence the outputs of sustainability assessments of transport systems to an extent that determines a tension between convenience, relevance, and comprehensiveness. As an example, a narrow definition of sustainable transport tends to favor individual technological solutions, while a broader definition, with higher stakeholder involvement, tends to favor more integrated solutions, including improved travel behaviors, economic incentives, institutional reforms, land use changes, as well as

technological innovation (Litman and Burwell 2006). Thus, when reporting assessment results, particular attention should be paid to the fairness of the delivery of the assumptions made about the concept of sustainability.

Technological Trends

Early discussions on the comparative assessment of advantages between different transport modes from a regional or global perspective, e.g., through an attributional prospective LCA, focused attention on the superior performance of particular systems, e.g., trains, over others, collective, over private vehicles (Spielmann et al. 2005).

More recently, in the context of substantial multisectoral efforts in technology innovation, this comparison has been exerted to alternative fuels and storage systems aimed at reducing or displacing emissions from highly inhabited areas and at decreasing the use of fossil fuels. Most of the time, these solutions stem from synergies with bio-based industries (Nanaki and Koroneos 2012) or the energy storage and smart grid sectors (Cherubini et al. 2015; Rizzi et al. 2014).

This has led to the consolidation of three streams of research: the incremental improvement of internal combustion engines (ICE), the coupling of ICE with alternative and renewable fuels, and alternative engines. Improvements in ICEs originate from regulatory-driven advancements in combustion research, electronics, materials science, and electrical engineering and are justified by the lock-ins in the industrial structure of incumbents (Berggren and Magnusson 2012). The pace of development of alternative engines is moderated by the orientation of incumbents to lobby for a reduction of future regulatory stringencies so as to be allowed to continue to invest in incremental innovations on ICEs, which have lower risks, lower costs, and less complexity (Berggren and Magnusson 2012; Vaz et al. 2017).

Nevertheless, ICEs can yield benefits in terms of reduced of greenhouse gas (GHG) emissions associated with the use of biodiesel, although this

often comes with higher emissions of PM₁₀, nitrous oxide, nitrogen oxides (NO_x), as well as nutrients such as nitrogen and phosphorous (Nanaki and Koroneos 2012).

Among alternative engines, electric vehicles coupled with low-carbon electricity sources are a promising solution that can solve both salient environmental problems in the use phase and stability issues of power grids caused by the increasing share of nonprogrammable renewable energy generation. The substitution of ICEs with large numbers of private-owned electric engines capable of equalizing peaks and valleys of exchanges in power grids could potentially reshape the truck, car, and scooter industries. Despite that, still much has to be done to reduce electric vehicle manufacturing impacts from a life-cycle perspective, which can be up to twice that of conventional vehicles in terms of global warming potential (GWP). Since even greater gaps might emerge for human toxicity potential (HTP) and mineral depletion potential (MDP), beside the development of cleaner production processes, stronger sustainability might be achieved also by means of a more circular end-of-life management of energy storage (Hawkins et al. 2013).

Another frequently advocated type of alternative engine refers to fuel cells, which might represent an interesting alternative to electric vehicles when associated to a large supply of cleaner renewable energies (e.g., wind) for hydrogen production (Bartolozzi et al. 2013).

Apart from the adoption of a specific technological platform, it is important to note that the overall design of vehicles plays an important role vis-à-vis making the most of the incremental improvements of ICE-technologies in modern vehicles or of the introduction of alternative fuels and engines. In fact, recent technological improvements have often been overshadowed by the tendency towards technological overshooting, which means that improvements in efficiency are used for increases in convenience, comfort and weight, faster acceleration, and higher top speed (Cuenot 2009).

Besides car use, environmental pressure is also stimulating innovation in rail, maritime, and

aviation systems, where the mainstream of incremental innovations aimed at increasing energy efficiency and the use of renewable energy sources is integrated by sector-specific interventions, e.g., the use of electric systems to switch off fuel-based power generation of ships during docking (Bailey and Solomon 2004).

In spite of the increasing stringency of policy interventions (e.g., the aviation industry, which had in the past faster rates of diffusion than technological improvement, was brought into the EU's emission trading scheme in 2012), technological innovation is necessary but unlikely to be the sole answer to the challenges and barriers for the transition towards sustainable transport systems. Indeed, behavioral change is a relevant aspect to be tackled to achieve both short-term and long-term goals (Chapman 2007).

Nontechnological Trends

Public transport is generally advocated as an efficient option for ensuring universal access to ecologically efficient mobility. Despite that, it often suffers for poor economic performance and low levels of customer satisfaction, especially in small and medium urban areas with a large diffusion of individual motorized transport (Grotenhuis et al. 2007).

In recent years, the need to deal with economic, ecological, population, and institutional constraints has given multimodal mobility a prominent role in avoiding regime stalemates and path dependency by capitalizing on the benefits of various systems. The shift towards sustainable urban multimodal mobility systems implies a significant change in social habits and behaviors, as well as trade offs between actors directly and indirectly involved in transport networks (Golinska and Hajdul 2012). Thus, it requires long-term orientation and clear orchestration to successfully adapt and innovate business models and invest in appropriate resources, such as customized smart services and ICTs (Spickermann et al. 2014).

Urban planning is a traditional key aspect in rationalizing the distribution of functional areas of the built environment and, thus, in minimizing the demand for transportation and in maximizing accessibility to public and shared transport systems (Chapman 2007). When coupled with sustainability assessment at the transportation planning level, it helps visualizing and assessing tradeoffs and dominance for competing alternatives at regional scales (Jeon et al. 2013). A robust planning phase lays the foundation of adequate operations.

Therefore, professional competencies usually complement design-based solutions by providing analytical skills and orchestration in the further phases, as in the case of mobility managers who assist members of large organizations to reduce individual and collective impacts of transport (Rotaris and Danielis 2015) and logistic managers who assist manufacturers to reduce freight kilometers and empty running (Chapman 2007).

More recently, modal shifts have also been favored also by the implementation of information and communication technologies, artificial intelligence, and related smart systems. These are capable of making information easily accessible, shared services more affordable and viral, and customers more informed and aware of the existence of new value propositions enabled by the sharing economy (see ► “Sharing Economy”). What is more, the diffusion of smart technologies has allowed an increasing number of innovative start-ups to foster dynamism in the competitive arena of transport service providers (Firnkor and Müller 2012).

It is worth noting that, despite evidence of environmental performance improvements both in terms of environmental emissions and land use associated with a shift from individual to collective or shared transport systems (Firnkor and Müller 2012), the impact of innovative transport systems on sustainability performance depends not just on the increased efficiency of the solution, but also on the possible rebound effects that might be generated by the easier and more universal access to transport systems (Binswanger 2001), especially in the case of high-speed transport technologies (Spielmann et al. 2008).

Summary

Economic development is associated with the increase of the demand, in terms of both volume and performance, of local and global transportation. Sustainable transportation originates from the attempt to decouple the increase of the demand for transportation from its negative environmental, social, and economic impacts. Progresses in this field highlight an intertwined evolution of, on the one hand, technical and nontechnical solutions and, on the other hand, sustainability metrics and principles. Coherently, sectoral policies have proven effective in fostering the correction of market imperfections and the internalization of environmental and social costs.

SWOR Analysis

Rute Abreu

Instituto Politécnico da Guarda, UDI-IPG, CICEF-IPCA & CISED-IPV, Guarda, Portugal

Synonyms

Assessment; Performance; SOFT Analysis; Strategic Plan; SWOT Analysis; TOWS Matrix

Definition

Strength (S), Weakness (W), Opportunity (O), and Risk (R) analysis with the acronym of SWOR is a strategic tool supported on a squared matrix based on past-experience, present-practice, and future-expectations associated with the internal situation strengths and weaknesses and with the external environment opportunities and risks to assess a company, a product or service, an idea, a partnership, an investment opportunity, or a new decision-making process.

History

The history of SWOR analysis starts with the research team of the Stanford Research Institute, from 1960 to 1970, where Marion Doshier, Otis Benepe, Robert Stewart, Birger Lie, and Albert

Humphrey have studied the reasons why corporate planning failed using data from Fortune 500 companies (Learned et al. 1965). Lyndall Urwick and John Leslie Orr, in 1964, as consultancy partners, used four categories for the SOFT analysis, knowing that in the present, good is classified as satisfactory and bad as a faulty; and in the future, good is classified as an opportunity and bad as a threat (Agarwal et al. 2012; Hill and Westbrook 1997; Urwick 1964). Hewlett (1999) defends that strategic planning “*helps a company decide what it wants to be when it grows up*” (Hewlett 1999, p. 26) and “*is very intensive, must be prepared to allocate the time and resources necessary to see it through*” (Hewlett 1999, p. 29).

In 1964, in Zurich, Switzerland, Humphrey presented in Long-Range Planning Seminar the SOFT analysis which details inefficiencies and efficiencies practices based on the analysis of being satisfactory, opportunistic, faulty, and threatening (Humphrey 2005; George 2017, p. 298). There are other researchers such as Porter (1980) and Jain (2015, p. 17) who argue that the modern SWOT analysis “was explained first (not originated) by Alfred Humphrey” and the origin of SWOT “*is in Thirukkural as the pancham veda (Fifth sacred book) of Tamilians is being looked at as a management handbook.*” Later with a new tendency, Weilrich (1982, p. 54) presented the TOWS matrix with threats and opportunities in the external environment and weaknesses and strengths inside the organization as a tool for situational analysis.

It is relevant to understand that the matrix proposed by the author is presented in Table 1, and Weilrich (1982, p. 54) starts on variables outside the organization to those variables inside to propose an “*effective and efficient attainment of its organizational objective and its mission.*”

SWOR Analysis, Table 1 The TOWS matrix

		Internal	
		Strengths	Weaknesses
External	Opportunities	SO	WO
	Threats	TS	WT

The matrix remained the same from the 1960s till today, but researchers published several frameworks (Helms and Nixon 2010). For example, Pandya (2017, p. 17) presents the LISA framework as “Leveraging” the strengths; “Improving” upon the weaknesses; “Seizing” the opportunities; and “Awareness” of the threats.” In another example, Valentin (2001, p. 54) presents in Table 2 a different SWOT framework based on the resource-based view with strategic associations that establish their significance.

Lengnick-Hall and Wolfe (1999) present a combination of pairs of components that must adhere to the logic of column combinations (i.e., component pairs combined within the matrix columns (strengths-opportunities (SO) and weaknesses-threats (WT)), row combinations (i.e., component pairs combined within the matrix rows (threats-opportunities (TO) and weaknesses-strengths (WS)), and diagonal combinations (i.e., component pairs combined within the matrix diagonals (weaknesses-opportunities (WO) and strengths-threats (ST)) as Table 3 represents.

Novicevic et al. (2004, p. 87) present the traditional SWOT analysis with a new “dual-perspective” framework with a controllable internal analysis subdivided by strengths (positive attributes) and weaknesses (negative attributes); and evaluative views of the uncontrollable external analysis subdivided by opportunities (desirable changes) and threats (undesirable changes) as Table 4 represents.

Geroge (2017, p. 303) presents the SWOT matrix “to improve organizational planning and

management,” based on internal factors (strengths as positive and weaknesses as negative) as attributes of the organization and external factors (opportunities as positive and threats as negative) as attributes of the environment as Table 5 represents.

It will be explaining the process of develop a SWOR analysis.

Proposal of SWOR Analysis

The proposal of the SWOR analysis is based on the strategic planning and as Roth et al. (2018, p. 1391) defines “business models that explicitly draw on the creative potential of functional differentiation as the distinctive feature of the modern society.” Furthermore, the SWOR matrix is proposal of development of the “strategic planning is merely a tool” (Bartling 1997, p. 20). Indeed, the greatest success of this tool is the “intellectual journey that the participants take in exploring the future” (Blatstein 2012, p. 32), but it “is not about predicting the future, what then is the objective? Strategic planning stresses the importance of making decision that will ensure the organization’s ability to successfully respond to changes in that environment” (Blatstein 2012, p. 32). Indeed, the organization must answer to the needs of stakeholders, but more relevant is to justify its mission with higher level of performance facing all the adversities and fighting with best strategies weapons. Without no doubt, the author agrees with Seelhofer (2016, p. 24) that

SWOR Analysis, Table 2 The SWOT framework

Factors	Internal	External
Favorable	Strengths	Opportunities
Unfavorable	Weaknesses	Threats

SWOR Analysis, Table 3 The SWOT components

Components	Weaknesses	Strengths
Threats	WT	ST
Opportunities	WO	SO

SWOR Analysis, Table 4 The traditional SWOT analysis with a new “dual-perspective” framework

Factors	Desirable	Undesirable
Uncontrollable	Opportunities	Threats
Controllable	Strengths	Weaknesses

SWOR Analysis, Table 5 The SWOT matrix

	Positive	Negative
Internal	Strengths	Weaknesses
External	Opportunities	Threats

describes “once developed and in the process of being implemented, the strategy’s fit with the organization’s environment should be reviewed periodically and revised as necessary.”

The fast and complex evolution on the economy and their consequences to management of the organization demands to change the focus from “threats” to “risks” based on the concept of risk of the ISO 31000 (IPQ 2013, p. 6). This standard defines risk as the “effect of uncertainty on objectives” but knowing that as the note 1 argues “the effect is a deviation from the expected positive and/or negative” (IPQ 2013, p. 6). Thus, the note 3 defines that risk “is often characterized by reference to potential events (3.5.1.3) and consequences (3.6.1.3), or a combination of these” (IPQ 2013, p. 6). Even though the note 5 describes that uncertainty “is the state, even partial, of deficiency of information related to, understanding or knowledge of, an event, its consequence, or likelihood” (IPQ 2013, p. 6).

The SWOR analysis is dependent on the perception of the consultant. In this sense, the ISO Standard 31,000 specifies that the “risk perception reflects the stakeholder’s needs, issues, knowledge, belief and values” (IPQ 2013, p. 9). Lalonde

and Boiral (2012) present an extensive checklist of guideline principles from the literature (IPQ 2011, 2016, 2017) and ISO Standard 31,000 (IPQ 2013) to improve risk management practices. Then, this analysis demonstrates vulnerabilities and expectations of strengths (S), weaknesses (W), opportunities (O), and risks (R).

Table 6 shows a diagonal increasing strategy from “good” to “bad” assessment. It is mandatory that the matrix must be squared (the same number of lines and columns). These assessments have been adopted from types of strategies developed by Aslan et al. (2012, p. 234). Indeed, first square starts on strategies that maximize strengths by taking advantage or wasted the opportunity (with the acronym SO); after the second square deals with strategies that minimize weakness by taking advantage or wasted the opportunity (with the acronym WO); later on, third square presents strategies that maximize strengths by avoiding and mitigating risks (with the acronym SR); and then on the fourth square displays strategies that minimize weakness by avoiding and mitigating risks (with the acronym WR).

Table 7 shows a diagonal increasing strategy from “bad” to “good” assessment. These

assessments have been adopted from types of strategies developed by Aslan et al. (2012, p. 234). Indeed, first square starts on strategies that minimize weakness by avoiding and mitigating risks (with the acronym WR); later, the second square deals with strategies that maximize strengths by avoiding and mitigating risks (with the acronym SR); after on the third square presents strategies that minimize weakness by taking advantage or wasted the opportunity (with the acronym WO); and then on the last square displays strategies that maximize strengths by taking advantage or wasted the opportunity (with the acronym SO).

This allows to balance the positive, negative, and null impacts with the same level of influence and to know that the dynamic of the analysis demands that in each interrelation between weaknesses and strengths versus risk and opportunities with variables: (+) Positive interaction: fighting the risk or taking advantage of the opportunity; (—) Negative interaction: avoid the risk or wasted opportunity and (0) Null interaction: nonexistent interrelation. Table 8 presents an example of the final composition of interaction.

This dynamic has been proposed by Weilrich (1982, p. 62) to “*identify combinations of relationships which, in turn, may become the basis for strategic choices.*” In addition to that process, the expert on strategic planning or the chief strategy officer could have several alternatives, but the result must give an analysis tool to improve the decision-making process.

The literature suggests using Analytical Hierarchy Process (AHP), proposed by Saaty (1980), to weight variables based on statistical behavior

(if they are quantitative) or content analysis (if they are qualitative) to prioritize cross analysis variables between them. The SWOR analysis improves performance to accomplish results (Watkins and Leigh 2010).

There is a huge diversity of developments, but the methodology recommended in Table 1 to the organization allows to propose $n \times n$ strategies based on each relation of SWOR. The expert on strategic planning or the chief strategy officer could start on lowest expectations to higher expectations as:

- The first square, WR, defines the strategy that minimize each weakness by minimizing each risk; therefore, it demands necessary assessment of the relative importance/influence of the relation to take the decision about weakness by avoiding and mitigating risks with, respectively, positive, or negative interaction.
- The second square, WO, related the strategy that minimize each weakness by maximizing each opportunity; therefore, it demands necessary to assess the relative importance/influence of the relation about strength to take the decision by taking advantage or wasted the opportunity, respectively, with a positive, or negative interaction.
- The third square, SR, defines the strategy that maximize each strength by minimizing each risk; therefore, it demands necessary to assess the relative importance/influence of the relation to take the decision about strength by avoiding and mitigating risks with, respectively, with positive, or negative interaction.
- The fourth square, SO, related the strategy that maximize the strength by maximize the opportunity; therefore, it demands necessary to assess the relative importance/influence of the relation about strength to take the decision by taking advantage or wasted the opportunity, respectively, with a positive, or negative interaction.

The author agrees with Barney (1996, p. 22), who says the SWOT analysis lies at the intersection between research and practice and, also,

SWOR Analysis, Table 8 Interactions of the SWOR matrix

	Weaknesses			Strengths		
Risk	+	—	0	—	+	0
	—	0	+	+	0	—
	0	+	—	0	—	+
Opportunities	0	+	—	—	0	+
	—	0	+	+	—	0
	+	—	0	0	+	—

details “*matching process in choosing strategies.*” So, the expert on strategic planning or the chief strategy officer that plans, develops, and assesses the analysis must know very well the organization to reduce redundant variables and to increase robust variables to justify the mission statement of the organization.

Due to the large experience of Weilrich (1982, p. 54), on the one hand, it is important to emphasize that “*many of goals of these claimants are incongruent with each other and it is the manager’s task to integrate these divergent needs and goals.*” On the other hand, Webb (2019, p. 1) argues “*linear timelines offer a certain amount of assurance: that events can be preordained, chaos can be contained, and success can be plotted and guaranteed.*”

The propose SWOR analysis starts with current situation to assess an organization, a product or service, an idea, a partnership, an investment opportunity, or a new decision-making process. The main objective is identified, for example, three strengths, weaknesses, opportunities, and risks. All this process demands a specific analysis for each assessment and as Porter et al. (2002, p. 44) teaches at the Harvard Business School the SWOT framework knowing that “*the prevailing SWOT model of strengths, weaknesses, opportunities, threats was based on the idea that every case is different and that the relevant considerations are company-specific.*” All this process ends when the strategic planning through the SWOR analysis produces the desire results.

Summary

For more than 100 years, the SWOR analysis has been consolidated as a robust strategic plan that allows to assess an organization, a product or service, an idea, a partnership, an investment opportunity, or a new decision-making process. In the first phase, it is very hard to “break stone” from anything on the organization, because it demands to start to identify SWOR analysis on the organization that it will change the present and it will build a new future and as Vladoš (2019, p. 348) details “*explore the problems.*” In the

second phase, it is interesting this process of selecting strategies and analyzing alternatives that best answer to the needs of the strategic position of the organization and as Vladoš (2019, p. 348) emphasizes “*the evolutionary approach to business dynamics.*” In the third phase, it is important to understand the SWOR analysis that this process involves subjectivity of the expert on strategic planning or the chief strategy officer on the three phases, but the assessment of alternatives for each strategy increases the quality of the analysis itself as Vladoš (2019, p. 348) argues “*discuss the limits and future prospects.*” At last, the SWOR analysis incorporates the strategic plan made with assessment of the mission, the vision, and values of the organization to create value to the future.

The Concept of System Transition

The term transition is widely applied in many scientific disciplines spanning from social

sciences (e.g., psychology) to natural sciences (e.g., physics) (Loorbach et al. 2017). In a literal sense, transition means going across and refers to the process of change from one state to another (Hölscher et al. 2018; Loorbach et al. 2017). In system studies, the concept “transition” typically refers to radical, nonlinear, and structural change in complex adaptive systems, such as socio-technical or social-ecological systems (Feola 2015; Patterson et al. 2016; Ostrom 2007). Bearing this in mind, in the chapter, the term “change” is perceived as an overarching concept for all terms that describe something that becomes different, such as transition or transformation. Adding to that, the term “transition” refers to socio-technical systems, whereas the term “transformation” emphasizes socio-ecological systems. Moreover, this chapter takes up the idea of “system” level as interchangeable word to describe the “societal” or “macro” level of society. In addition, the terms “system” and “systemic” are used interchangeably in the chapter.

Fuenfschilling and Binz (2018) note that in system transition literature, transition is understood as a shift from one socio-technical regime to another. In turn, according to Walker et al. (2004), in social-ecological research, change occurs when system transgresses the so-called tipping points and moves to a new stable state. Planetary boundaries can be perceived as such tipping points at Earth system scale, although definition and exact measure of the boundary is more complex and subject to scientific debate (Steffen et al. 2015). Whereas socio-technical transition research focuses on enabling a desired transition, social-ecological system research aims to improve understanding of the critical thresholds and ways to improve resilience of environmental systems (Smith and Stirling 2008). Here, the focus is rather on the former type of transition, yet it is important to understand the commonalities in the change dynamics. To this end, this chapter embraces the concept of systemic transition defined by Grin et al. (2010) who explain societal system transitions as follows:

Transitions are co-evolution processes that require multiple changes in sociotechnical systems and configurations. [...] [They are] multi-actor processes, [...] radical shifts from one system or

configuration to another. The term “radical” refers to the scope of change. [...] Transitions are “long-term processes” and “macroscopic.”

Loorbach et al. (2017) stress systemic transitions being changes that reconstruct entire societal systems. The essence of system in social-ecological approach is distinguished as a co-evolution between social and environmental systems at either particular geographical area or global scale. In turn, the emphasis of socio-technical approach is on the co-evolution of technology, institutions, and practices at societal level, not necessarily bound to spatial scale, but rather to the hierarchy of rule structure. System transition research applies this perspective and explores how to embark greater degrees of sustainability facilitated through a structural change from tenacious unsustainability (Geels and Schot 2007; Markard et al. 2012; Loorbach et al. 2017). In other words, transitions, in the discipline of system transition, aim at achieving a greater degree of sustainability.

The emergence of the concept of systemic transition took place in 1990s across different disciplines as a contemporary means to address societal changes to sustainability (O’Riordan 1996; Raskin 2002; Costanza 1992; Kemp 1994). According to Loorbach et al. (2017), the current field of system transition research evolved in the 1990s by building on at least two different ontologies. The stream of innovation research forms the prior one (Rip and Kemp 1998; Arthur 1994; van den Bergh and Gowdy 2000). The latter is a compound of the partly overlapping disciplines of environmental studies and sustainability sciences (Kemp 1994; O’Riordan 2001; Van Asselt and Rotmans 1996; Rotmans 1998).

Loorbach et al. (2017) propose that the emergence of systemic transition research is explained by the need for novel research approaches as attempts to explore the dynamics of societal problems, and consequently, to seek systemic solutions to them. Thus, systemic transitions typically explore changes in societal subsystems, for example, food system, by emphasizing various interactions at social, technological, and institutional levels (Geels and Schot 2010; Loorbach et al. 2017; Fuenfschilling and Binz 2018).

System transition research entails a prevailing notion that disruptive systemic change can be located in so-called regimes: the dominant order in a societal system or subsystem (Loorbach et al. 2017). Geels (2010) explains the concept of the regime referring to the “deep-structure” or “grammar” of a socio-technical system, defining appropriate, legitimate, and conceivable means-end rationalities in a given sector, in other words the “mainstream” logic of system functioning.

Since the objective of the transition literature is to pay further attention to the plethora of unsustainabilities in the global system, and how to overcome them, the next section describes the sustainability science as a background literature for transition research. Moreover, the socio-ecological system is addressed in more detail to provide an example of a different system where sustainability science is applied. The next section also discusses the concepts of socio-technical system and its landscape, regime, and niche as important elements of systemic transition. After addressing the literature, the chapter presents how system transition research is currently applied and what are the emerging developments in the field.

Literature

Sustainability Science

In 1987, United Nations World Commission on Environment and Development (WCED) report “Our Common Future” included a definition for sustainable development. Currently, this definition is broadly applied, and thus, this chapter follows the definition set by United Nations. The report defines sustainable development as follows:

Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs. (Brundtland 1987)

Sparked by the Brundtland’s report and mounting sustainability challenges, academia witnessed an emergence of novel a discipline, sustainability science, in the late 1990s (Clark and Dickson 2003; Kates et al. 2001; Swart et al. 2004; Wiek

et al. 2012). In the early millennia, Kates et al. (2001) defined three main objectives of sustainability science: (1) understanding the fundamental interactions between nature and society; (2) guiding these interactions along sustainable trajectories; and (3) promoting the social learning necessary to navigate the transition to sustainability.

In addition to academic work, the sustainability challenges have sparked about a wide array of societal responses from industries and civil society companies as well (Lang et al. 2012).

Despite the emergence of sustainability science, Brandt et al. (2013) stress that the pursuit of sustainable development, in line with the WCED's definition, has not succeeded. To this end, Geels (2011) argue the global system being burdened by various threats of sustainability. Similarly, Rockström et al. (2009a) note human activities being accountable for major sustainability problems that have led to surpassing the planetary boundaries of the Earth system. Therefore, the need for systemic transitions remains evident. Thus, the discipline of system transition emerged to implement sustainable development on a system level (Markard et al. 2012; Köhler et al. 2019), by expanding the analytic scope of problem framing and the scale of action and solution needed (Smith et al. 2010).

Social-Ecological System

Mounting sustainability challenges, such as climate change and biophysical nutrient cycling, initiated the need for socio-ecological research. According to Folke et al. (2005) the emergence of social-ecological research from the natural sciences occurred due to declining the view of ecosystem changes being linear, predictable, and controllable. Thus, socio-ecological research entails a vested notion that social and environmental systems are tightly coupled. Socio-ecological studies include resilience and transformation in human-environmental interactions and feedbacks in to break the existing unsustainable developments as its fundamental notions (Westley et al. 2011; Folke et al. 2011; Olsson and Galaz 2012; Steffen et al. 2011).

As reported by Berkes et al. (2002), system's resilience refers to the capability to defend external forces and maintain the basic nature and functioning while facing a disruption. Taking a closer look, the greater society's resilience is in confronting change externally brought about, the greater its ability to absorb external shocks and perturbations is, and vice versa (Adger et al. 2005). However, as the external influence increases beyond certain tipping points – thresholds – even a minor change can lead to major system alterations without any prior notice or warning signals (Waltner-Toews et al. 2008). Since such change is expected to be uncertain and the consequences are unpredictable, in socio-ecological research, sustainability is seen to be dependent on the maintenance of the adaptive capability to hold up social and economic systems (Berkes et al. 2002). To this end, resilience studies have recently embraced an adaptation to shocks by change (Carpenter et al. 2001). Zooming closer, an active and deliberate transformation on lower scales is considered to sustain resilience on a higher scale (Folke et al. 2010).

The key notion of resilience is the realization that system stability and equilibrium are not considered as normal state for a system. To this end, resilience studies pay emphasis on uncertainty and understanding change as continuous part of the system, and thus, resilience research stresses the proactive role of individuals, communities, and institutions in managing change (Folke 2006). In addition, recognizing the concept of critical thresholds or tipping points, beyond which the system, as broad as the Earth system, can degenerate to unexpected and irreversible state has been another prominent contribution in the socio-ecological studies (Biermann et al. 2012). Therefore, socio-ecological research attempts to take a precautionary approach vis-à-vis global environmental change. Taking a closer look, assessing the resilience at Earth scale appears crucial. Thus, defining and quantifying planetary boundaries, that is, the safe operating space for human kind, has played an important role in socio-ecological research (Rockström et al. 2009b; Steffen et al. 2015).

Systemic Transition, Fig. 1 Different levels of the socio-technical system. (Adapted from Geels 2002)

Socio-technical System

Rip and Kemp (1998) state that system transition literature focuses on understanding sustainability problems as inherent in existing, unsustainable, socio-technical systems. To this end, the rigid configurations of institutions, techniques, and artifacts, as well as the rules, practices, and networks set the trajectory for a typical development within socio-technical systems (Rip and Kemp 1998).

Socio-technical approach prevails the notion of society consisting from sectors, such as food and transportation, which provide certain societal needs, and consequently, they together form socio-technical systems (Markard et al. 2012). Going forward, actors (e.g., individuals, firms) – and networks of actors – and institutions (e.g., technical norms) as well as material artifacts and knowledge are also seen to constitute a socio-technical system (Geels 2004; Markard 2011; Weber 2003). As such, technology is embedded in the social institutions, and the co-evolution of the two, the social and the technical, give rise to incumbent socio-technical structure.

Research in socio-technical system transition is heavily influenced by the multilevel perspective (MLP) and research into the history of technology (Rip and Kemp 1998; Geels 2002; Loorbach et al.

2017). The research on systemic transition entail a vested notion on multilevel interplay between incumbent regime structures, external landscape pressures, and emerging niches leading to processes of technological changes (Geels 2002). The empirical studies are often consisted to explore these change dynamics (Loorbach et al. 2017). Figure 1, adapted from Geels (2002), illustrates the different levels of the socio-technical system.

Loorbach et al. (2017) argue that the subject of system transition is typically the socio-technical regimes that evolve path-dependently building on dominant technologies. System transition research entails an important assumption that socio-technical systems are rigid and inert, which results in change and innovation being incremental and path-dependent (Geels 2002; Markard and Truffer 2008). According to Fuenfschilling and Binz (2018), stability in socio-technical systems is due to the presence of highly institutionalized formal and informal rules that have co-evolved with certain technologies and solidified into practices and routines. Path-dependency can even lead to system lock-in, in which vested interests and sunk costs make regime shift an impasse (Unruh 2000). Typical examples in the research of transitions are systems, such as energy or food, in which

infrastructures and technologies are crucial (Loorbach et al. 2017).

Socio-technical Landscape

Geels and Schot (2010) note that the concept of landscape builds on various views from wide-ranging theories of technological change in societal setting. Researchers in several fields, such as history, archeology, anthropology, and philosophy, consider technology as part of the material culture of societies (Geels and Schot 2010). Moreover, Stones (2005) has argued that structuration research in sociology would benefit from being placed within a broader social, historical, and geographical framework. Hence, landscape can be perceived as the macro level of a society.

The extant system transition literature conceptualizes the socio-technical landscape as an exogenous environment beyond the direct influence of niche and regime actors and it represents macro-economics, deep cultural patterns, macro-political developments (Geels and Schot 2007). The socio-technical landscape contains a set of heterogeneous factors, such as oil prices, economic growth, wars, emigration, broad political coalitions, cultural and normative values, and environmental problems (Geels 2002). The landscape is an external structure or context for interactions of actors and it does not include actors itself (Fischer and Newig 2016; Geels 2002). The context of landscape is even harder to change than that of regimes, which means that landscapes do change, but more slowly than regimes – it may take decades to change landscapes (Geels 2002; Geels and Schot 2007).

Socio-technical Regimes

Loorbach et al. (2017) have argued the notion of regime being the most essential concept for entire systemic transition studies. Regime can be perceived as dominant and stable order of a system (Dosi 1982; Kemp 1994; Rip and Kemp 1998; Geels 2002). To this end, regime level represents the meso-level of a society. Rip and Kemp (1998) have defined socio-technical regimes as follows:

The rule-set or grammar embedded in a complex of engineering practices, production process technologies, product characteristics, skills and procedures,

ways of handling relevant artefacts and persons, ways of defining problems; all of them embedded in institutions and infrastructures.

The conceptualization of regime in system transition literature is built on Nelson's and Winter's (1982) concept of technological regimes in evolutionary economics. In their definition, technological regimes refer to the cognitive routines shared in a community of engineers (Nelson and Winter 1982). Later in the system transition literature regimes were conceptualized as semi-coherent rule sets carried by different social groups, which stabilize a technological trajectory and function as a selection and retention mechanism (Geels 2002; Smith et al. 2005). Building on neo-institutional theory Geels (2004) proposed that the rules of regimes consist of three types: cognitive, regulative, and normative.

Hence, regime in a socio-technical system is often described as the dominant institutional logic of the system (Fuenfschilling and Truffer 2014; Thornton et al. 2012). This view entails the idea that the concept of regime is not constant nor stable rather than continuously socially constructed, as regimes are persistently contested and under various power battles by different actors (Fuenfschilling and Truffer 2016; Geels 2014; Geels et al. 2016; Smink et al. 2015). Consequently, the socio-technical regime can be perceived as the result of an interplay between actors, technologies, and institutions in a system (Fuenfschilling and Binz 2018). These dynamics unveil the difficulty to initiate radical innovations, while the existing system favors incremental innovations in regime changes (Geels and Schot 2007). This path-dependency and lock-in are noted as the defining factor of socio-technical regimes (Fuenfschilling and Binz 2018).

Socio-technical Niches

Socio-technical niches portray the micro-level of a society. In system transition literature, technological niches form the micro-level where radical novelties emerge (Geels and Schot 2007). These novelties are initially unstable socio-technical configurations with low performance (Geels and Schot 2007). According to evolutionary theories,

radical innovations often emerge outside or on the fringe of existing regimes, where niches act as “incubation rooms” protecting novelties against mainstream market selection (Schot 1998; Kemp et al. 1998; Geels and Schot 2010). Geels and Schot (2007) state that in system transition literature, niche-innovations are carried and developed by small networks of dedicated actors, often outsiders or fringe actors.

The scholars in system transition literature explicitly incorporate science and technology studies insights and agency into evolutionary theory (Geels and Schot 2010). Elaborated by Kemp et al. (1998), technological niches are carried by experimental projects, where new technologies are exposed to actors from the selection environment under relatively protected circumstances. Networks of dedicated actors who are willing to invest resources in the new technology typically protect niches (Geels and Schot 2010). This protection enables the shielded development of niches to eventually challenge and even replace the existing regime (Kemp et al. 1998).

Current Developments in the Field

The research field of system transition has increased considerably over the past decades and it has become an important area of research into the nonlinear dynamics of societal change, highly relevant to policy and society in the context of grand challenges (Loorbach et al. 2017). According to Köhler et al. (2019) early publications of system transition often focused on electricity and transport systems, and current articles regularly explore other societal domains, such as food, water, heat and buildings, cities, and waste management. Contemporary transition literature has notably broadened its scope compared to the early system transition discipline. Recently systemic transition studies have revolved, for example, around urban transitions, acceleration, system decline, system re-configuration and interaction between multiple innovations, ethics and justice, the role of users, power relations in governance structures, and transitions involving multiple sectors (Köhler et al. 2019). The economic stagnation

and degrowth, destabilization and collapse, transitions and democracy, and attempts to bridge the gap between descriptive analytical transition dynamics and prescriptive transition policies are noted as emerging themes in the contemporary system transition research as well (Loorbach et al. 2017).

Moreover, system transition research has recently brought forward a theoretical debate concerning the core concepts of the research field. At the moment, the concepts of regime and niche are contested (Fuenfschilling and Binz 2018; Fuenfschilling and Truffer 2016). To better address the question of how institutional change unfolds, there has emerged research openings adopting institutional theories to amend system transition literature (Fuenfschilling and Binz 2018). In addition, many recent contributions call for a more nuanced analysis of the spatial dimensions of transition dynamics (e.g., Binz and Truffer 2017; Coenen et al. 2012; Raven et al. 2012).

The aim of system transitions research remains being the incorporation of established disciplines such as political sciences, business studies, development studies, and science and technology studies (Köhler et al. 2019). However, Loorbach et al. (2017) have argued that realizing the full academic and societal potential of system transition literature would require both critical observation of the entire research branch and further appreciation on more diverse views from other disciplines. These various emerging research openings and themes point to the continuing expansion of the systemic transition field and demonstrate the usefulness of system transition in the efforts of achieving sustainable societies.

Summary

Systemic transitions are changes that reconstruct entire societal systems. Systemic transitions have gained increasing interest since 1990s across the academia as a contemporary means to address societal changes to sustainability. Systemic transition literature emphasizes the coevolution of technology, institutions, and practices at societal

level. Currently, the discipline studying systemic transitions is undergoing continuous expansion.

Systems Approach

► Systems Thinking

Systems Thinking

Scott T. Davis and Hiroshi Sasaki

College of Business, Rikkyo University, Tokyo, Japan

Synonyms

Systemic thinking; Systems approach

Summary

Systems thinking is a method of analysis using frameworks that are based upon a theory of systems. The goal of systems thinking is to facilitate a better understanding of problems and complex situations by enabling the conceptualization and analysis of the structures, dynamics, and perspectives within and by which they are contexted. A wide range of systems thinking frameworks have been developed over time and they have been shaped by changes in the understanding of the nature of systems, their dynamics, and the objectives for their analysis. Although numerous and varied, these frameworks commonly share several

key structural concepts including systems, holism, boundaries, hierarchy, and emergence. Systems thinking frameworks can be classified upon the basis of these influences over time into categories of soft, hard, and critical approaches.

The Systems Thinking Approach

Systems thinking is a response to the perceived need to understand phenomena in terms of the whole rather than simply the parts, as a dynamic of interactions between elements over time, and as being based upon a purposeful and subjective world view. Systems thinking is a framework whereby some form of systems theory is applied to the analysis of a problem in order to identify its problem situation and develop a plan for action. The systems thinking approach is particularly concerned with the resolution of problems within complex situations defined by nonlinear system behavior.

This review will present a brief overview of the systems thinking approach from its: (1) starting point in the analysis of complex problem situations, (2) key defining concepts, (3) the development over time of major frameworks within the approach, and (4) typologies of systems thinking approach frameworks.

Complexity and Problems

The conceptualization of problems within complex situations is fundamental to an understanding of the systems thinking approach. In the years during and after the Second World War, developments in the scientific, technological, business, and economic fields were defined by the increasing speed of innovation, diversity among, and interaction between systems.

More recently, the dynamics of military conflict in the post-Cold War period have been characterized as volatile, uncertain, complex, and ambiguous under an acronym of VUCA and used as a tool to make sense of the dynamic nature of interrelationships that define business environments (Bennett and Lemoine 2014). The

proliferation and growing importance of strategies based on open systems, combined with innovations in information technology that give voice to interests from different perspectives, give particular importance to the “A” – *ambiguity* – in VUCA.

Systems theorists take the position that the complex problems which arise from the dynamics of open systems are not amenable to solutions based solely upon a reductionistic examination of their constituent parts. The goal of systems thinking is not to reduce complexity but to understand it. As explained by Hitchins, in contrast to a reductionist approach, “system theory affords the opportunity to manage complexity; that is, to effectively conceal perceived complexity so that our limited intellects can comprehend without being swamped by detail and variety. A system may be represented, not by its structure, function, form, etc., but by its emergent properties, capabilities and behaviors” (Hitchins 2008, p. 51).

Systems thinking approaches have developed against this background of growing awareness of the prevalence and criticality of problems characterized by increasing levels of complexity and ambiguity, along with the realization that prevailing reductionistic methods of problem analysis may in fact act to exacerbate the perception of complexity.

Systems thinking as defined by Gharajedaghi is the “art of simplifying complexity. It is about seeing through chaos, managing interdependency, and understanding choice. We see the world as increasingly more complex and chaotic because we use inadequate concepts to explain it. When we understand something, we no longer see it as chaotic or complex” (Gharajedaghi 2011, p. 335). For Gharajedaghi, the perception of complexity is also a product of the process of perception. The systems thinking approach thereby reflects a changing understanding of the nature and meaning of complexity as a concept for understanding problems and not as a problem in itself.

One of the defining characteristics of systems thinking approach frameworks is therefore the process they apply in defining problems. Complex problems have been conceptualized in a variety of ways by systems thinking theorists as *messes*

(Ackoff 1981a), *wicked problems* (Rittel and Webber 1973), and *resource dilemmas* (Blackmore 2007, p. 512). Rittel and Webber draw a comparison between the “tame” problems that concern the natural sciences – for which the objectives and achievement of solutions can be clarified in advance – with what they call the wicked problems of complex situations in social contexts (Rittel and Webber 1973). Rittel’s definition of wicked problems has been summarized by Churchman as “that class of social system problems which are ill-formulated, where the information is confusing, where there are many clients and decision makers with conflicting values, and where the ramifications in the whole system are thoroughly confusing” (Churchman 1967, pp. B-141). The scope of Rittel’s definition of wicked problems included most social problems confronted by planners (Rittel and Webber 1973, p. 160).

Rittel and Webber elaborated their conceptualization of a wicked problem in their “ten properties” which distinguished wicked from tame problems by attributing to them – among other characteristics – the qualities of being impossible to define objectively, embedded in their social contexts and therefore related to other factors in such a way that their effects and solution impacts are never fully measurable, always unique yet related to higher-order problems and only solvable using solutions which are good or bad and not true or false because of the relativity of the planner with regards to the perspectives of those involved (Rittel and Webber 1973, pp. 161–167).

Rittel and Webber’s definition of wicked problems was developed to explain the situation faced by actors engaged in social planning. Ackoff, taking a position which is essentially compatible with that of Rittel and Webber, has focused on the problems faced by business managers and defined problems as essentially abstractions derived from messes as artifacts of the management process. For Ackoff:

managers are not confronted with problems that are independent of each other, but with dynamic situations that consist of complex systems of changing problems that interact with each other. . . Problems are abstractions extracted from messes by analysis;

they are to messes as atoms are to tables and chairs. We experience messes, tables, and chairs; not problems and atoms. Because messes are systems of problems, the sum of the optimal solutions to each component problem taken separately is not an optimal solution to the mess. The behavior of a mess depends more on how the solutions to its parts interact than on how they act independently of each other. But the unit in OR [Operational Research] is a problem, not a mess. Managers do not solve problems; they manage messes. (Ackoff 1979, pp. 99–100)

Systems thinking approaches therefore assume a contextualized view of problems wherein the interrelatedness of factors within and between systems is acknowledged and the relativity derived from the different perspectives and interests of actors is considered in the definition of problem situations. A result of this is the emphasis given to defining problem situations and their resolution by systemic innovation rather than the identification of immediate problems and their solutions.

Systems thinking is a process for understanding the organized nature of reality. According to Capra and Luisi, systems thinking “means a shift of perception from material objects and structures to the nonmaterial processes and patterns of organization that represent the very essence of life” (Capra and Luisi 2014, p. 79). This defining characteristic of a focus on the analysis of processes over materials is reflected in the concepts used by theorists of the systems thinking approach.

The Language of Systems Thinking

Systems thinking frameworks share a common terminology of key concepts. Jackson refers to these concepts as the language of systems thinking (Jackson 2003, p. 3). The key concepts of the systems thinking approach include systems, elements, structures, holism, boundaries, hierarchy, and emergence.

Systems: Elements, Relationships, and Purpose

For systems thinking theorists a system consists of a “set of elements in interaction” (von Bertalanffy

1968) wherein all elements are connected either directly or indirectly with each other (Ackoff 1971, p. 662) to form a complex whole which is functionally dependent upon all these elements and their interactions (Jackson 2003, p. 3). Although a collection of elements without significant patterns of interaction or with clearly linear patterns of interaction is amenable to reductionistic scientific analysis (von Bertalanffy 1968, p. 18), systems thinking theorists contend that a reductionistic approach is ineffective for the analysis of systems shaped by organized complexity (von Bertalanffy 1968, p. 34). In contrast to a reductionist approach wherein the disaggregation of a system's elements into isolated parts is central, the organized system itself is the primary focus of the systems thinking approach.

An organized system is one that is purposeful. Ackoff defines a purposeful system as one that: "contains at least two purposeful elements which have a common purpose relative to which the system has a functional division of labor; its functionally distinct subsets can respond to each other's behavior through observation or communication; and at least one subset has a system-control function" (Ackoff 1971, p. 670). For systems thinking theorists therefore social situations and problems are amenable to analysis by virtue of their being contexted in complex and purposeful systems (Bruni et al. 2018, p. 242).

Systems are structured. The structure of a system is derived from the sets of its constituent elements and the interactions between them. The properties of the system's elements are defined as attributes and the set of a system's attributes define its state. A system's state can be (1) static, stable in the absence of events; (2) dynamic, moving between several different possible states; or (3) homeostatic, wherein the dynamic interaction of its elements adjust to maintain an overall static state. Systems display both change and behavior. Change is the effect of environmental events on the system and behavior is the effect of the system on its external environment (Ackoff 1971).

Holism

The systems thinking approach is based upon the position that the behavior of complex systems can

only be understood as wholes. For systems thinking approach theorists identifying a system as a whole in order to understand its behavior are central issues. According to Boardman and Sauser, a

systems thinker understands that complexity is made up of lots of things that interact with one another in curious, counterintuitive ways. This makes decomposition, the disaggregation of these various things into their separate existences, less useful. If we separate them we no longer have them, because they exist together. (Boardman and Sauser 2008, p. 15)

The systems thinking approach shifts the focus of understanding the world from its parts to the whole. According to Capra:

The first, and most general, criterion is the shift from the parts to the whole. Living systems are integrated wholes whose properties cannot be reduced to those of smaller parts. Their essential, or 'systemic,' properties are proper ties of the whole, which none of the parts have. They arise from the 'organizing relations' of the parts – that is, from a configuration of ordered relationships that is characteristic of that particular class of organisms, or systems. Systemic properties are destroyed when a system is dissected into isolated elements. (Capra 1996, p. 36)

The whole therefore is the nature of a complex system that is irreducible to the individual properties of its constituent elements. Formulations of the concept of "holism" can be located as early as the writings of Aristotle. Aristotle described the unique whole of an organism in terms of being its "potential." Aristotle maintained that:

It is evident that even of the things that are thought to be substances, most are [only] potentialities: the parts of animals (for none of them, having been separated, is [the part of an animal], and when they are separated, then all of them exist [merely] as matter), and earth and fire and air; for none of them is one, but they are like a heap, until they are concocted and some one thing comes to be out of them. All [the parts] will exist [only] potentially when they are one and continuous by nature. (as quoted in: Mayhew 1997, p. 327)

Here Aristotle is concerned with life as an emergent property of bodies. In 1933 von Bertalanffy – a biologist whose theories strongly influenced early systems thinking – addressed the same issue in modern terms when he stated that:

since the fundamental character of the living thing is its organization, the customary investigation of the single parts and processes, even the most thorough physico-chemical analysis, cannot provide a complete explanation of the vital phenomena. This investigation gives us no information about the co-ordination of the parts and processes in the complicated system of the living whole which constitutes the essential 'nature' of the organism, and by which the reactions in the organism are distinguished from those in the test-tube. (von Bertalanffy 1933, pp. 64–65).

Aristotle's "potential" and von Bertalanffy's "nature" have also been conceptualized as the "meaning" (Jackson 2003, pp. 3–4) and "properties" (Simon 1962, p. 468) the system gives to its parts when seen as a whole. For the systems thinking approach the meaning of the parts of a system are derived from the whole. The contention of systems thinking is that a reductionistic analysis of the whole by examining the independent characteristics of its constituent elements will (1) not fully explain the behavior displayed by a system, nor (2) enable the future possible behaviors of that system to be predicted.

Boundaries and Hierarchies

In order to be approached holistically a system must be properly defined. Systems are defined by boundaries. A boundary is the difference made by an observer in distinguishing a system from its environment (Checkland 1999, p. 312). The observation and analysis of a system require the identification of the elements constituting the system, as well as the extent of their interactions within it and beyond it with its environment through a process known as "systemic resolution" whereby a systems boundary is defined. Identifying a system against the background of its wider context in accordance with a specific issue or concern is called defining the "system of interest."

Relationships outside of the boundary of a system may cause it to be linked to other systems in the form of hierarchies. Systems can be hierarchic in structure where systems may be interrelated to each other vertically as super- and subsystems (Simon 1962, p. 468). This leads to complexity. For Simon: "complexity frequently takes the form of hierarchy, and that hierarchic

systems have some common properties that are independent of their specific content" (Simon 1962, p. 468).

Emergence

For systems thinking theorists, understanding the complexity of systems means understanding non-linear behavior or "emergence" as a property of systems. Emergence is a consequence of the fundamental system concepts of holism and interaction (Hitchins 2008, p. 27). Checkland has defined emergence as "the principle that entities exhibit properties which are meaningful only when attributed to the whole, not to its parts" (Checkland 1999, p. 314). Emergence is the behavior of the system as a whole – its *potential* according to Aristotle.

The capability of flight is an emergent behavior for a bird as a holistically defined system. The emergent behaviors of a system are their "system properties" which Lenk and Stephan define as being possessed by a system but not by its individual constituent parts (Lenk and Stephan 2002, p. 21). Emergent properties can be defined as emergent if: "although it arises out of the properties and relations characterizing its simpler constituents, it is neither predictable from, nor reducible to, these lower-level characteristics" (Honderich 2005, p. 239). Systems are therefore not simply the structures which result from the relationships between a systems constituent elements but instead to the coupled processes that exist between the interaction of system elements. As a result, emergence is the behavior of system which is either novel and therefore unable to be predicted or instantiated but systemic and therefore difficult to be explained reductively.

A key concern regarding emergence for systems thinking is predictability. Systems thinking scholars have devoted given considerable attention to the analysis of emergence in terms of its predictability. Emergence is generally classified depending on its level of predictability; the more difficult a system behavior is to predict the stronger its emergence is considered to be. "Simple" emergence is the behavior evidenced by a designed system (controlled movement in the case of an automobile), "weak" emergence is

derived from the system structure but cannot be explained from its parts, and “unexpected” emergence is impossible to predict (consciousness as a behavior of the human brain, or the sudden failure of a complex system). Systems thinking theorists tend to focus on strong emergence, some such as Chroust refer to weaker forms of emergence as “system-level behavior” (Chroust 2002).

Unexpected emergence is usually associated with systemic failure and shock which has led some systems thinking theorists to construe the identification and prediction of negative impact and undesirable shocks to be one of the primary goals of systems thinking (Hitchins 2008). François has classified unpredictable emergence into two forms: (1) properties which could be predicted but are not due to lack of information and (2) properties which are “in and of themselves, not derivable a priori from the behavior of the parts of the system” (François 2004, p. 737). This unknowable character of complex systems is characteristic of the subject matter of the social sciences.

Systems Thinking Frameworks

Although there exists a basic language common to most systems thinking theorists, a large number of divergent models (frameworks) of system thinking have developed over time under the influence of both the issues and theories of their respective periods (Midgley and Lindhult 2017, p. 7). As the frameworks of each period gained ground and were applied in practice, both their achievements and shortcomings became the subject of study and critique and the material upon which new frameworks were developed. Several major studies have been undertaken to categorize the different frameworks of systems thinking approaches and trace their development. These studies include two exhaustive collections of original papers of key theorists compiled by Midgley (2003), François (2004) and several comprehensive analytical expositions by Jackson (2002, 2003).

The history of the development of the systems thinking approach is a move towards greater concern with holism and pluralism. Midgley has

classified the development of systems thinking over time in terms of three waves (Midgley 2006). Midgley traces the first wave to the 1930s with the development of general systems theory, cybernetics, and complexity theory (Midgley 2006, p. 13). The second wave is identified in the 1950s and 1960s with the development of soft systems models, while the third wave commences in the 1980s and is characterized by frameworks of critical systems thinking. Rather than representing three distinct chronological phases, these waves are better understood as a series of developments within the field as new frameworks were introduced. These waves also represent a series of paradigmatic shifts in the Kuhnian sense (Kuhn 2012) as new frameworks are developed to redress the perceived shortcomings of previous approaches.

First Wave: Hard Systems

The first wave is characterized by what is known as hard systems theory. The “hard” in hard systems refers to the assumption that systems have clearly identifiable goals and structured boundaries, thus making them hard in the sense that they are objective and grounded in reality. According to Reynolds and Holwell, systems thinking approaches can be divided into one of two categories: (1) those designed to facilitate *thinking about systems* as real-world ontological entities in contrast to (2) those designed to enable *systems thinking* as an epistemological construct (Reynolds and Holwell 2010, p. 17). The early hard forms of systems thinking fall into the former category due to their assumption that systems exist in the real world and need to be discovered and explained accurately and correctly.

Within the first wave the systems thinking approach was seen as a means to optimize system performance in pursuit of a set goal using engineering methods to optimize a solution. According to Jackson, hard systems theory:

offered managers and management scientists a means of seeking to optimize the performance of a system in pursuit of clearly identified goals. Emphasis is placed on the application of a systematic methodology that, having established objectives, is able to identify problems that stand in the way

of optimization and rectify them by employing scientific modelling, rational testing, implementation and evaluation processes. (Jackson 2003, p. 16)

Hard system approaches assume that irrespective of their complexity problems these can be understood as they exist in the real world and are amenable to solution by a process of system optimization. Representative models of this hard approach include general systems, cybernetics, systems dynamics, and viable systems modeling.

General systems theory as represented by the work of von Bertalanffy was of great importance in the development of the earliest systems thinking approach frameworks (von Bertalanffy 1968, 1972). Von Bertalanffy's contention was that examining the connectedness, context, and feedback between parts yields an understanding of the whole that could not be gained from only examining the constituent parts of a system (von Bertalanffy 1968). General systems theory therefore represents a rejection of reductionist forms of scientific inquiry and instead maintains that an understanding of the general rules by which phenomena in open systems are organized will yield a better explanation of their emergent behaviors and survivability within their environmental context. General systems theory emphasizes the understanding of the simple rules that underlie all systems and by which all systems can be understood. This approach contends that knowledge gained regarding one system should be applicable in order to promote understanding of other systems. Many of the concepts common to systems thinking approaches are derived from GST and include system boundaries, hierarchies and embeddedness, emergence, and system survivability.

The lesson of cybernetics is that causality is systemic in nature. According to Midgley the "basic idea in cybernetics is feedback" (Midgley 2006, p. 15). **Cybernetics** emphasizes the effect of feedback within systems. Feedback loops of negative and/or positive reinforcement are identified as shaping the performance of systems as they interact. The insight here is that the optimal effect of actions on subsystem levels may combine to create suboptimal effects on the larger system

level resulting in the situation known as system failure. According to Midgley, this insight "offers a methodology and model for evaluating organizational failures without simply attributing blame to a single individual" (Midgley 2006, p. 17).

Developed by Forrester in the 1960s, **systems dynamics** was developed to model dynamic systems behavior such as supply chains and demographics (Forrester 1961). Systems dynamics applies concepts from cybernetics to understand system behavior as environmentally contexted wholes. The systems dynamics model focuses on explaining the nonlinearity of complex situations over time in terms of feedback loops, stocks, and flows (Reynolds and Holwell 2010, p. 17). The systems dynamics approach later figured prominently in Senge's *Fifth Discipline* where its characteristic concepts of feedback and control were applied as the framework for systems thinking (Senge 1990).

One of the earliest specific applications of the hard systems approach to organizations was that of Beer's **viable system modeling** framework (Beer 1972), which compared actual with ideal models of organizations based upon cybernetic and systems theories in order to identify problems (Midgley and Lindhult 2017, p. 8). Viability for Beer was the ability of an organization to adapt in order to survive within a changing environment as an independent entity over time.

The hard system approaches of the 1950s and 1960s aimed to apply the methodology of operational research in order to bring objectivity to the analysis of human systems. This assumed that reality could be described objectively and represented in a manner which was both accurate and true. As a result, these approaches have been criticized for being unsuited for the analysis of human systems which are inherently subjective and the intersubjectivity that defines society. Specifically, critics of the first wave have argued that these shortcomings meant that hard systems approaches were: (1) unsuited to deal with complexity derived from differences among the beliefs and values of actors and the relationships of power between them (Jackson 2003, p. 16), (2) failed to recognize that the search for objectivity resulted in prioritizing the perspective of the

analyst over all other system actors in system modeling (Midgley and Lindhult 2017, p. 9), and (3) ill-equipped to understand the ongoing negotiation of meaning that defines reality for individuals in social systems due to the limitations of the feedback process models of systems engineering (Jackson 2003, p. 80).

Second Wave: Soft Systems

The second wave was marked by the development of soft systems models which were designed as frameworks for systems intervention and emerged in the 1970s and 1980s. The term “soft systems” was coined by Checkland who sought to differentiate between the first wave of approaches which assumed systems to be objectifiable, real-world entities from the newly developed approaches that took systems to be epistemological constructs (Checkland 1978).

Soft systems thinking approaches assumed that systems are social constructs and are therefore open and subjective rather than closed and objective as assumed during the first wave. The concern of soft systems thinking models was to make subjectivity central, replace the concern with defining immutable systems goals, and instead accommodate different and even conflicting world views. According to Midgley, the objective of soft systems models “shifted from being that of constructing systems to utilizing systems to promote understanding” (Midgley 2006, pp. 20–21).

For soft systems thinking theorists a system is comprised of multiple intersubjective relationships, the mapping of which is a means of promoting dialogue among actors with differing perspectives and enable the reframing of problematic situations from the perspective of multiple stakeholders, thus enhancing the potential for innovation (Ulrich 1983). The soft systems thinking theorists maintain that the complexity of social systems defies prediction and that the goal of system mapping should therefore be to emphasize systemic learning among stakeholders about possible courses of action (Sterman 1994). Correspondingly, rather than system boundaries as an indication of reality, Churchman – a leading figure in the second wave – saw boundaries as indicative of the limits of knowledge (Midgley 2006, p. 21).

The definition of system boundaries assumed particular importance in this period as the delimitation of systems came to be seen as an indicator of the limits of knowledge and participation as shown in the work of Ackoff (1981b). Incorporating a dimension of intersubjectivity gave new meaning to the importance of defining boundaries. According to Mele, Pels, and Polese, the “concept of a system is not connected with the notion of objectivity, but instead refers to a specific point of view and can vary from actor to actor; it strictly depends on the contextualized system’s perception in time and space” (Mele et al. 2010, pp. 129–130). Soft problems are problems which are defined differently in accordance with the perspective of the actor and are therefore difficult to define in a uniform manner.

Perspectives differ, they can shift over time, and a system thinker can in fact benefit from assessing situations from multiple and contrasting perspectives. For Churchman systems thinking was cyclical in nature – described as a never-ending process of perception and deception as the right questions by which to comprehend situations and their problems were sought only to find an answer, be deceived by it, and go on to seek a better question (Churchman 1968).

Holism under the second wave models was seen as the product of knowledge boundary expansion rather than just of a comprehensive depiction of a system’s characteristics. As explained by Midgley it meant “expanding the boundaries of our knowledge about whatever we are studying, together with the boundaries defining the set of people involved in generating that knowledge” (Midgley 2006, p. 22).

Soft systems thinking models are primarily concerned with framing problematic situations within their intersubjective and relative contexts. Soft system approaches tended, therefore, to eschew the definition of single problems for solution, and instead conceptualize problem situations from a variety of perspectives which should be managed by systemic interventions. Problem situations are analyzed with the objective of enabling the actors involved in the situation to assess it in an interactive and reflective manner in

order to plan for a systemic intervention to resolve (manage) it rather than simply solving it.

Known collectively as problem structuring methods (Mingers and Rosenhead 2004), these soft models share the characteristics of using systems thinking in order to guide the analysis of situations by including consideration of the values and interests of those involved and maintaining that contradictions in their respective mental models of reality must be included in problem situation analysis, considered when devising preferable futures, and accommodated in planned interventions. These problem structuring methods thereby aim at facilitating the process for framing the issues constituting a problem situation and actively accommodate plurality by focusing analysis to promote an understanding of a situation and develop an ideal future situation.

A large number of soft systems frameworks have been proposed. Representative methodologies include: soft systems methodology, strategic assumption surfacing and testing, and strategic options development and analysis.

Developed by Checkland (1981; Checkland and Scholes 1990), **soft systems methodology** is a method for system redesign wherein participants build ideal-type conceptual models in accordance with the worldview of each stakeholder group which are then used to compare perceptions of current situations in order to promote dialogue regarding what changes could be both acceptable in terms of interests and feasible in terms of their overall utility. The objective here was to enable stakeholders to actively consider the relative meaning of potential systemic interventions as part of the planning process.

Pioneered by Mason and Mitroff (1981), **strategic assumption surfacing and testing** is, as its name suggests, a method for identifying the assumptions that underlie a stakeholder's perception of problems and their possible solutions and discussing them in comparison with the assumptions and goals of other stakeholders. Using this method groups of stakeholders independently define unstructured problems and develop strategies for their resolution which they then compare and discuss with other groups in a process designed to reveal the key assumptions which

underlie both the perceptions of problems and proposed systemic interactions. Intersubjectivity is thereby made an explicit part of the process whereby problems are structured and analyzed rather than solved.

The **strategic options development and analysis** method created by Eden (1988, 1992; Eden et al. 1983) uses systems thinking to develop diagrams called "cognitive maps" which visualize the values, beliefs, and worldviews of stakeholders involved in a problematic situation. The cognitive maps produced by each stakeholder are then merged and used as the basis for discussing the goals, strategic directions, and potential options in planning for systemic interventions to resolve the situation.

The hard and soft approaches can be distinguished by their respective emphasis on defining as opposed to understanding systems, identifying problems as opposed to understanding problematic contexts, and posing solutions as opposed to reducing the discomfort of the situation (Flood and Carson 1993). Unlike the hard systems approach which assumes a knowable goal and structure, the soft approach presumes an unknown environment which requires the development and application of learning processes to promote understanding and generate knowledge to guide positive action.

Wave Three: Critical Systems

The third wave is characterized by the development of frameworks of critical systems thinking. The "critical" in CST has two meanings: critical regarding the assumptions of hard and soft approaches, and critical in its recognition of a dimension of power in systems.

Although they share the same epistemological orientation of the soft approaches, the critical systems thinking approach has been developed as a response to the problems perceived in both the hard and earlier soft approaches – that of inability to recognize imbalances in power among the constituents of a system and the limits that this places upon system definition and analysis in terms of knowledge and assumptions. Arguing that the conceptualization of participation emphasized in the second wave models lacked a consideration of

the effect of power and authority in shaping relationships and action, critical systems frameworks were designed to accommodate situations defined by asymmetrical power relationships and disenfranchisement.

Critical systems thinking is a humanized approach to system analysis that recognizes the existence and legitimacy of multiple perspectives and imbalances of power and their effect in producing and prolonging problems that otherwise resist solution. Systems under third wave frameworks are populated by stakeholders who, as the constituents of a situation, are defined by their own distinct identities, values, and interests – the expression and fulfillment of which becomes a key issue in conceptualizing phenomena and planning action.

Among the key models developed in this period are the critical systems heuristics framework of Ulrich (1983), and the systemic intervention framework of Midgley (1992).

Critical heuristics of social systems design as defined by Ulrich (1987) is concerned with a critique of “boundary judgments” that demark the system to be analyzed from its environment and the legitimation of the facts and values upon which this is based. Ulrich maintains that these boundary judgments are made in two ways: whole system judgments and justification break-offs. Whole system judgments are the “assumptions about what belongs to the section of the real world to be studied and improved and what falls outside the reach of this effort,” while justification break-offs are the “demarcation of the context of application that is to be relevant when it comes to justifying the normative implications of a design for those affected by its effects” (Ulrich 1987, p. 278). In this way Ulrich effectively calls for the conscious and critical recognition of, and reflection upon, the values which serve to legitimate the definition of situations and the proposals for action to address the problems perceived within them. Boundaries are therefore issues of motivation, power, knowledge, and legitimation within the critical heuristics approach to systems thinking (Ulrich 2000) – each of which require conscious and reflective assessment in order for situations to be analyzed and action planned

within contexts populated by stakeholders of different perspectives, interests, and power. The critical approach to systems thinking attempts to avoid dogmatism by recognizing the existence of multiple perspectives and interests which can be in conflict with and even irreconcilable with each other and thereby adopting a pluralist perspective beyond that of the second wave approaches.

Midgley proposed the **systemic intervention** model in order to make the examination of relationships of power a central feature of the analysis of problem situations. This emphasis on power relationships can be seen in the assumptions underlying the model. Midgley’s systemic intervention model is hinged upon the three key assumptions that: (1) everything is connected, (2) complex systems extend beyond the boundaries and values understandable from of any single perspective, and (3) that intervention in systems (by either action or inaction) is unavoidable. According to Midgley, boundaries are the most fundamental concept of systems (the most useful concept for attempts for reframing by planned action) under the systemic intervention model because: (1) human perception itself is based on framing (making distinctions between phenomena in process of cognition), and (2) awareness of phenomena (“perspectives, parts, wholes, interactions, and emergent properties”) is based upon and strongly influenced by pre-existing boundary judgments (Midgley and Lindhult 2017, p. 12).

Classifications of Systems Thinking Approaches

Several systems have been proposed for classifying models within the various approaches to ST. These classifications include Midgley’s three wave classification of hard, soft, and critical approaches as employed in this review of systems thinking models given above.

Building upon Midgley’s classification, Reynolds and Holwell have classified systems thinking models into three categories in accordance with their objectives as purposeful activity: (1) understanding complex situations by simplifying them

Systems Thinking, Table 1 Classifications of key models of systems thinking approaches

Dimensions		Representative models (theorists)
Midgley (2003)	Jackson (2001, 2003)	
Hard	Functionalist	von Bertalanffy (1968) General Systems Theory, Churchman (1968) Operations Research
Soft	Interpretivist	Checkland (1972) Soft Systems Methodology, Ackoff (1981b) Interactive Management
Critical	Emancipatory	Ulrich (1983) Critical Heuristics of Social Systems Design, Midgley (2000) Systemic intervention

Source: Adapted from Jackson (2001) and Jackson (2003)

in a meaningful way, (2) revealing differences in perspectives and interests within a situation, and (3) promote reflection on the relationships of power and definitions of boundaries within a system (Reynolds and Holwell 2010, p. 17).

Jackson and Keys have proposed a system of systems methodologies typology for classifying holistic approaches to systems thinking (Jackson and Keys 1984). The SOSM is a matrix comprised of two dimensions – systems and participants. Systems are divided into two groups – simple and complex. Simple systems are (1) relatively stable over time, (2) comprised of a limited number of subsystems which interact through structured interactions, and (3) little influenced by internal or environmental factors. Complex systems are on the opposite end of the spectrum and are characterized by: (1) a tendency to change and evolve as a result of (2) fluid interactions between their many constituent subsystems and (3) a tendency to be influenced by their parts and environments. The participants dimension is divided into three groups – unitary, pluralist, and coercive – each representing “relationships that can exist between those concerned with the problem context” (Jackson 2003, p. 19). Participants in a unitary relationship are defined by (1) shared values, interests, and purposes, and (2) are involved in decision-making processes for planning action. Participants in a pluralist relationship (1) share basic interests but not values, therefore (2) their goal setting and decision-making processes require “space” to facilitate discussion and debate in order to agree on objectives. Participants in a coercive relationship (1) subscribe to potentially conflicting beliefs and share neither values nor

interests and (2) in the absence of the possibility for compromise in setting objectives decisions are made upon the basis of power (Jackson 2003, p. 19).

As illustrated in Table 1, Jackson and Keys’ unitary, pluralist, and coercive definitions of participants could also be explained as functionalist, interpretivist, and emancipatory approaches to systems analysis and correlated with Midgley’s hard, soft, and critical classifications.

Models developed based upon systems thinking approaches for the analysis of complexity, nonlinearity, and unpredictability in the world have and continue to exert considerable influence on the way that social actors create and change their worldviews, examine their own and others’ understandings of the world, and define and realize their expectations for the future.

Tall Building Sustainability

Abbas Aminmansour
University of Illinois at Urbana-Champaign,
Champaign, IL, USA

Synonyms

[High-rise](#); [Skyscraper](#); [Tower building](#)

Description

The term tall building is relative and has different meanings in different contexts and at different times. A 30-story building may not be considered tall in Hong Kong or New York City today. But in a relatively small city such as Champaign, Illinois, it will be considered tall. On the other hand, while a 30-story building may not stand out as tall in

New York City now, in the early 1900s it would have received considerable attention as a tall building.

There is no universal definition for what is considered a tall building. However, the Council on Tall Buildings and Urban Habitat (CTBUH, [2023a](#)) defines supertall buildings as those with heights of 300 m (984 feet) or taller and megatall as those having heights of 600 m (1968 feet) or more.

Sustainable design of tall buildings (Oldfield, [2019](#)), particularly supertall and megatall buildings, is key in today's urban density (Güller & Tokuç, [2020](#)) and sustainable development (Jeronen, [2020](#); Krannich & Reiser, [2021](#)). Due to their large scale, construction and operation of tall buildings play a significant role in sustainable development.

Urbanization and the Need for Tall Buildings

The World Bank ([2023a](#)) estimates that about 56% of the world's population lived in urban areas in 2021. That is up by 9% compared to 20 years earlier. The percentage of urban population varies from continent to continent (World Bank, [2023b](#)). The Americas, Greenland, and Australia have high urban populations with over 80% of their residents living in urban areas. The United States is at about 83%; Canada at about 82%; Mexico at about 81%; and Argentina at

about 92%. Much of Africa has the lowest percentages with urban populations of about 20%, 30%, and 40% with some exception such as Libya at about 80%. Asia and Asia Pacific have a mix of urban population rates ranging from about 26% (Afghanistan) to Islamic Republic of Iran at 76% and Singapore at 100%. Europe also has a mix of urban population rates ranging from about 50% (e.g., Romania) to 100% (e.g., Monaco).

The trend worldwide is, however, that the rate of urbanization is higher than the rate of population growth. In 2021, the rate of global population growth was 0.9% (World Bank, 2023c) while the rate of urbanization over the same year was 1.6% (World Bank, 2023d). With the world population having been 7.89 billion in 2021 (World Bank, 2023e), this represents a global migration rate of 10.5 million per month from suburban to urban areas. For context, according to the United States Census Bureau (United States Census Bureau, n.d.), the population of New York City in July of 2021 was about 8.47 million. This global migrating to urban areas is equivalent to the birth of 1.24 New York cities per month!

People move to urban areas for a variety of reasons with the most obvious ones being career opportunities (Fig. 1) and lifestyle changes (Fig. 2). In doing so, they need places to live and to work (Johnson, 2017; Kahraman, 2020; Zhongjie & Gamez, 1998).

A particular trend observed among the urban migrants is young people seeking a lifestyle that allows them to live near their work (Fig. 3). A group referred to as Double Income No Children (DINC) comprises a considerable portion of the urban dwellers.

Another obvious group of urban migrants are empty nesters – middle-aged or older people who have no children living with them anymore and seek the advantages of living in apartments or condominiums in dense city centers. For them, the benefits are worry-free residences, and the advantage of shopping, restaurants, and places of entertainment that are either within walking distance or a short taxi ride away.

To accommodate the increase of their urban population, some cities such as Melbourne, Australia, have room to expand their geographic

Tall Building Sustainability,

Fig. 3 Young shopper in an urban shop. (Photo: Adobe Stock)

extent (Fig. 4). However, big cities that do not have room to grow such as Hong Kong (Fig. 5) have no option but to build vertical. According to the SkyscraperCenter web site maintained by the Council on Tall Buildings and Urban Habitat (CTBUH), Hong Kong has 553 buildings at 150 m or taller; 98 buildings at 200 m or taller; and 6 buildings at 300 m or taller, making it the number one global city with the greatest number of buildings at 150 m or taller (CTBUH, 2023b).

New York has had to develop unusually slender tall buildings such as those in what is called

the Billionaires-row (Fig. 6) due to lack of land. There have even been cases when developers obtained what is known as the excess development rights from other buildings to build taller on their own site.

Developers in some cities with very little to no land to develop have had to resort to building on sites with significant constraints. An example is 150 North Riverside in Chicago which was built on top of Amtrak railroad tracks and adjacent to the river (Fig. 7). The land was partially owned by Amtrak National Railroad Passenger Corporation,

Tall Building Sustainability, Fig. 4 Vast suburb of Melbourne. (Photo: Adobe Stock)

Tall Building Sustainability, Fig. 5 Hong Kong bounded by mountains and water. (Photo: Adobe Stock)

partially by the City of Chicago, and partially by a private owner. Further, construction had to take place without disrupting railroad traffic and there were very few specific locations where foundations could be placed in between rail tracks. The design and construction of the tower presented some serious challenges for the design team.

There have been even entire large metropolitan areas born at a miraculous speed to accommodate the need for new urban areas. According to encyclopedia Britannica (Britannica, The Editors of Encyclopedia, 2023), Shenzhen, China, was a rural port city of about 30,000 inhabitants in 1979. Beginning with 1980, the city began a very rapid growth known in China as the

“Shenzhen speed” with large domestic and foreign investments. Today, Shenzhen is one of the world’s most significant centers of technology and commerce (Fig. 8) with a population of about 17.6 million.

Astonishingly, with just over 40 years of age in its modern form, Shenzhen has one of the highest population densities in the world with about 8600 people per kilometer square (CTBUH, 2023b) with 366 buildings at 150 m or taller; 130 buildings at 200 m or taller; and 16 buildings at 300 m or taller, making it the city with the second largest number of buildings at 150 m or taller. Shenzhen is part of Pearl River Delta, the largest megacity in the world which among others includes Hong

Kong, Macau, Guangzhou, and Dongguan with a population of about 65 million and about 250 buildings at 200 m or taller.

The bottom line is, with the high rate of migration to major cities around the world, tall buildings have become an essential building form and part of today's contemporary landscape. Development of tall buildings has seen considerable growth of 8% each year since 1950 (MIT Technology Review, 2018). This growth has been higher in certain parts of the world such as parts of Asia including Western Asia (also known as Middle East) (CTBUH, 2023b). Interestingly, the high rate of development of tall buildings cannot be solely attributed to the increasing urbanization. There appears to be a rush to build tall, not just based on need, but based on other factors as well. They include the personality characteristics of some developers who want to build taller than the competition, and occupants who want to have a condominium

or office address in a supertall building and are willing to pay to achieve their goal.

Are Tall Buildings Sustainable?

Being tall (Fig. 9) comes at a premium. The taller you go, the higher the premium (Aminmansour, 2009).

Tall buildings are susceptible to lateral loads, force in the horizontal direction such as wind and earthquake forces. Lateral loads cause tall buildings to bend and sway. While excessive movement does not necessarily pose a structural safety concern, it may make the building's occupants feel sick or uncomfortable and may damage building components such as walls, partitions, doors, windows, pipes, elevator shafts, and so on. Therefore, tall buildings need to be made stiff enough to control their movement to an acceptable level. The structural system that

Tall Building Sustainability,

Fig. 9 Shanghai World Financial Center, Jin Mao tower, and Shanghai tower. (Photo: Adobe Stock)

provides this stiffness for tall buildings is called the lateral load resisting system.

Lateral load resisting systems of tall buildings require additional material, well beyond what is required to support the weight of the building and its contents, also known as the gravity load resisting system. In other words, tall buildings require a higher rate of structural material per unit floor area than shorter buildings with the same total floor area. This increase in material use is referred to as the premium for height.

Information developed by the late legendary structural engineer Fazlur Rahman Khan (Khan, 2004) illustrates the premium for height. Per Khan, a 30-story building with a steel frame requires about 10 pounds per square foot of steel (48.8 kilograms per square meter) for its gravity load resisting system and an additional three pounds per square foot (14.6 kilograms per square meter) for its lateral load resisting system. The premium for height for this 30-story building is 30% additional steel over what is needed for its gravity load resisting system. Now consider a 100-story steel framed building. This building would require about 25 pounds per square foot (122 kilograms per square meter) of structural steel for its gravity load resisting system and an additional 65 pounds per square foot (317 kilograms per square meter) of structural steel for its lateral load resisting system. The premium for

height of a 100-story building is 260% as opposed to 30% for a 30-story building. In other words, the 100-story building, which is 3.33 times taller than a 30-story building, pays a premium for height of almost nine times as much!

There are ways to minimize the premium for height such as selecting the most appropriate structural system for a particular tall building depending on its height and material (e.g., steel or concrete). Ali and Moon (2007) offer a comprehensive coverage of proper selection of the most appropriate structural system for tall buildings. Many of today's tall buildings utilize concrete as their structural material partly because concrete provides a better stiffness for the building. However, concrete includes cement which is widely believed to generate as high as about 7% of total global CO₂ emissions (EPA, 2021). Though there have been advances in at least partially using other materials to replace cement (e.g., fly ash), there is still a significant carbon footprint associated with construction of tall concrete buildings.

Delivering material to high height during construction of tall buildings requires special equipment and consumes more energy than construction of buildings that are not as tall. Further, during the life of the building, water and conditioned air need to be delivered to high heights, consuming more energy and increasing the carbon footprint of the building.

From energy consumption point of view, typically modern tall buildings have large amounts of glass in their exterior walls (Fig. 10). While glass technology has improved over the years, it is still not the most efficient insulation material in terms of heat gain and heat loss, adding to higher demand for conditioned air for the extraordinarily large volume of the building over its life. In addition, at times tall buildings have higher floor-to-ceiling heights to make spaces feel larger and for penetrating more natural light deeper in the interior spaces of the building. This feature not only increases the amount of glass used, but it also increases the volume of the building that needs to be conditioned during the life of the building.

The core of a tall building which houses the elevator shafts, safe egress, and building services such as the mechanical, electrical, and plumbing components takes up floor space, on every floor, reducing the efficiency of the floors and adversely

affecting the sustainability of tall buildings. It is not uncommon for floors of a tall building to lose somewhere around 15%, 20%, even 30% of their floor area to the building core (Firehouse, 2004). Additionally, elevators consume a considerable amount of energy, in the range of up to about 10% of the building's total energy consumption during its life (GTM, 2020) and again adversely affecting their sustainability. New technologies are on the horizon that would help with more efficient design of elevators including magnetic elevator cabs that can not only move vertically but can move horizontally on certain floors as well allowing sharing of the same shaft with more than one elevator cab.

Tall buildings are built as if they are permanent fixtures on the face of the earth with no regard for their end of life. The fact is that they have a useful and economical life span. A tall building may be renovated and repurposed up to a point. But at some point, it needs to be deconstructed. This phase will have a considerable environmental effect, but regrettably, it appears that not many consider this factor in the development of tall buildings. Life Cycle Assessment (LCA) and sustainability of tall buildings must consider deconstruction at the end of the building's life including disposal of building material. This is another area where tall buildings do not fare well.

Tall buildings are typically designed by the best in their profession and are as efficient and economical as they can be (Aminmansour, 2009; Aminmansour & Moon, 2010). However, they are not as "sustainable" as buildings that are not tall but have the same total floor area. But, as will be discussed in the next section, tall buildings have a significant sustainability impact in their home communities.

Sustainability Impact of Tall Buildings

Tall buildings have several characteristics that lead to significant positive environmental impacts. They provide space for people to live and to work in dense urban areas. Well-designed urban density offers considerable positive

Tall Building Sustainability, Fig. 10 Toronto Dominion Centre, Toronto. (Photo: A. Aminmansour)

Tall Building Sustainability, Fig. 11 Aqua Tower, Chicago. (Photo: A. Aminmansour)

environmental benefits as follows. Consider, for example, the Aqua Tower in Chicago (Fig. 11). According to Emporis which recognized the building as the Skyscraper of the Year in 2009, the 86-story, 262-meter-tall building offers 736 residential units including 262 condominium units in the upper levels and 474 rental units in the midlevels in addition to 55,000 square feet of commercial office space at the first and second floors (Emporis, 2023). If the 736 residential units alone were disbursed on the outskirts of the city, they would take up a significant amount of land – very likely agricultural land – which would amount to hundreds of times the area of land the tower sits on (Fig. 12). In addition to the land they occupy, these residences would require water, electricity, gas, sewage, and other services that would have a significant negative environmental

impact to build and to maintain due to their distance and distributed spread (Du & Wood, 2017).

Inhabitants of suburban residential units would require a substantial road and bridge system that needs to be constructed and maintained regularly to provide access to their places of work. Each resident will likely spend hundreds of hours commuting to and from work each year and cause vehicular wear and tear, fuel consumption, and fume generation (Fig. 13).

In addition, because of their significantly large scale, tall buildings offer substantial opportunities for environmental impact. For example, imagine a tall building which renovates its lighting system, one of the major sources of energy consumption during the operational life of the building, by switching to low energy-consuming or occupant-sensing lighting system. Even a 10% decrease in energy consumption of the building would amount to a very large amount. Or consider mail and package delivery to a tall building for all its occupants versus delivering them to hundreds of locations in the suburbs.

Cities with skylines including tall buildings are perceived as forward-looking, visionary, and financially prosperous. Indeed, many such cities are centers of regional and global commerce and have very strong tourism industries (Fig. 14). Tall buildings have proven to be magnets for new developments, bringing in more businesses and helping the local economy. For example, at the time when Willis Tower (formerly Sears Tower) was constructed in Chicago, the area was underdeveloped. Now, the area is significantly developed and highly sought after by businesses and residents, making it one of the most expensive areas in the city. Furthermore, after completion, some tall buildings end up in the portfolios of investment and insurance companies, providing economic benefits for more than the developer.

Assessing tall buildings' sustainability using the same metrics as those used for low rise buildings is misguided. We need a much more holistic evaluation of tall buildings' sustainability which includes other factors outlined above, among others.

Tall Building Sustainability, Fig. 14 Skyline of Singapore, a major center of global finance and tourism. (Photo: Adobe Stock)

Summary

Tall buildings are clearly an essential form of building topology as vertical urbanism through density is viewed as a more and more viable solution that offers places for people to live and to work. They provide a lifestyle desired by considerable sectors of society and usually come with spectacular views, attract more businesses, and help the tourism industry among other benefits.

Tall buildings are intrinsically not “sustainable” if assessed based on the criteria used for low-rise buildings. On a per unit floor area (e.g., per square meter), tall buildings consume a larger amount of construction material, have a higher rate of energy consumption, and are less economical to design and build than their shorter counterparts with the same total floor area. However, a holistic study of the characteristics of tall buildings shows that they do indeed have a significant

sustainability impact in their home community. Unlike low rise buildings, the sustainability impact of tall buildings reaches far beyond their physical boundaries.

Tax

Stefania Vignini
Department of Management, University of
Bologna, Bologna, Italy

Definition

A tax (from the Latin *taxo*) is a compulsory financial charge or some other type of levy imposed upon a taxpayer (an individual or other legal entity) by a governmental organization in order to fund various public expenditures (McLure 1970). A failure to pay, along with evasion of or resistance to taxation, is punishable by law. Taxes consist of direct or indirect taxes and may be paid in money or as its labor equivalent.

Legal Definition

The legal definition and the economic definition of taxes differ in some ways such as economists do not regard many transfers to governments as taxes. For example, some transfers to the public sector are comparable to prices. Examples include tuition at public universities and fees for utilities provided by local governments. Governments also obtain resources by “creating” money and coins (e.g., by printing bills and by minting coins), through voluntary gifts (e.g., contributions to public universities and museums), by imposing penalties (such as traffic fines), by borrowing, and also by confiscating wealth. From the view of economists, a tax is a nonpenal, yet compulsory transfer of resources from the private to the public sector, levied on a basis of predetermined criteria and without reference to specific benefit received.

Economic Definition

In economic terms, taxation transfers wealth from households or businesses to the government of a

nation. Adam Smith writes in *The Wealth of Nations* that:

...the economic incomes of private people are of three main types: rent, profit and wages. Ordinary taxpayers will ultimately pay their taxes from at least one of these revenue sources. The government may intend that a particular tax should fall exclusively on rent, profit, or wages – and that another tax should fall on all three private income sources jointly. However, many taxes will inevitably fall on resources and persons very different from those intended ... Good taxes meet four major criteria. They are (1) proportionate to incomes or abilities to pay (2) certain rather than arbitrary (3) payable at times and in ways convenient to the taxpayers and (4) cheap to administer and collect. (Smith 2015, p. 429)

In modern taxation systems, governments levy taxes in money; but in-kind and *corvée* taxation are characteristic of traditional or pre-capitalist states and their functional equivalents. The method of taxation and the government expenditure of taxes raised are often highly debated in politics and economics. Tax collection is performed by a government agency such as the Ghana Revenue Authority, Canada Revenue Agency, Internal Revenue Service (IRS) in the United States, Her Majesty’s Revenue and Customs (HMRC) in the United Kingdom, or Federal Tax Service in Russia. When taxes are not fully paid, the state may impose civil penalties (such as fines or forfeiture) or criminal penalties (such as incarceration) on the non-paying entity or individual.

Most countries have a tax system in place to pay for public, common, or agreed national needs and government functions. Some levy a flat percentage rate of taxation on personal annual income, but most scale taxes are based on annual income amounts. Most countries charge a tax both on corporate income and dividends. Countries or subunits often also impose wealth taxes, property taxes, sales taxes, value-added taxes, payroll taxes, or tariffs. In the OECD classification, the term “taxes” is confined to compulsory, unrequited payments to general government. Taxes are unrequited in the sense that benefits provided by government to taxpayers are not normally in proportion to their payments.

For different taxes by country, see tax rates around the world.

Taxes generally fall into the following non-exhaustive list:

1. Income tax (Aaron 1976). *Income tax usually may include:*
 - Capital gains tax (tax on the sale of an investment, usually stocks, bonds, precious metals and property).
 - Corporate tax (levied on the earnings or profits of a corporation).
 - Dividend tax (tax on dividends paid to shareholders of a company).
 - Excess profits tax (tax on unusually high profits levied on a corporation). This was largely levied in the United States in times of war to prevent war profiteering but has been proposed at other times.
 - Flat tax (income tax where everyone pays the same tax rate).
 - Gift tax (tax on gifts given (generally paid by the person making the gift, not by the recipient).
 - Gross receipts tax (tax on revenues received by a corporation, even if they don't profit).
 - Hall–Rabushka flat tax (a particular flat tax on income that excludes investments).
 - Inheritance tax (tax paid on money gained through inheritance).
 - Negative income tax (income tax where the poor receive payment from the government, instead of owing taxes).
 - Windfall profits tax (tax on profits gained by a company that has some kind of large unexpected profit).
2. Payroll tax
3. Property tax
4. Consumption tax
5. Tariff (taxes on international trade)
6. Capitation (a fixed tax charged per person)
7. Fees and tolls
8. Effective taxes (government policies that aren't explicitly taxes, but result in income to the government through losses to the public).

A comparison of tax rates by countries is very difficult and somewhat subjective, as tax

laws in most countries are extremely complex and the tax burden falls differently on different groups in each country and sub-national unit. The list focuses on the main indicative types of taxes: corporate tax, individual income tax, and sales tax, including VAT and GST (see *Economic Data and Statistics on World Economy and Economic Freedom*. www.heritage.org)

Low Tax Countries

The following are not tax-free countries, but they tax their residents on a territorial basis and, to the best of our research, don't have CFC laws. This essentially means that these countries tax only the income earned from activity within their borders, not overseas income. However, one would need to take precautions when remitting money, as it may be treated differently if it is held within a controlled foreign corporation that if it is brought in personally for use in the country.

The bottom line is that these jurisdictions have very favorable tax treatments, but if you are a legal resident there, you should make sure that any income you remit into the country isn't taxable as local-sourced income. Also, you should always consult a tax adviser.

- Anguilla
- Belize
- Costa Rica
- Georgia
- Gibraltar
- Guatemala
- Hong Kong
- Macau
- Malaysia
- Malta
- Nicaragua
- Panama
- Paraguay
- Qatar
- Singapore
- Thailand
- Uruguay

Tax-Free Countries

- The Bahamas. The Bahamas imposes no income tax on its residents and receives most of its revenue from tourism and its robust off-shore industry.
- The British Virgin Islands.
- Brunei.
- The Cayman Islands.
- Monaco.
- Oman.
- Turks and Caicos.
- The United Arab Emirates. The United Arab Emirates does not levy personal income and corporate taxes (except some economic activities such as oil, gas, and financial services). You can easily get a residency visa by setting up a 100% foreign-owned company in one of its more than 40 free trade areas. In addition, it is possible to set up an offshore company in the emirates of Dubai, Ajman, and Ras Al Khaimah. With a Dubai's offshore company, you can even own real estate in certain Dubai's development projects.
- Vanuatu.

Tax Benefits in Brazil

Henrique Formigoni and Alexandre de Almeida
Universidade Presbiteriana Mackenzie, São Paulo, Brazil

Synonyms

[Investment allowances](#); [Tax breaks](#); [Tax credits](#); [Tax holidays](#); [Tax incentives](#); [Tax relief](#); [Tax savings](#)

Definition/Description

The authors agree with Sanchez-Ugarte (1995) that tax benefits are forms of tax incentives or subsidies and may be defined as a reduction in either the tax rate, the tax base, or the tax liability, which is granted if a specified action is taken by the selected beneficiary/taxpayer selected on the basis of qualifications. They can be grouped into several categories, such as tax holidays, investment allowances, tax credits, timing differences, and free economic zones.

Introduction

Tax benefits in the form of incentives in Brazil are typically granted for investments – e.g., tax-free zones, tax holidays, timing differences, deferment and reduced tax rates or basis under special tax and customs regimes, and free economic zones. As a general rule, they are granted through tax laws and regulations. This is an attempt to increase transparency and avoid disputes.

Resident and nonresident investors through local subsidiaries may request and benefit from tax incentives in Brazil. Tax benefits may be granted by (i) the Federal Union, (ii) the 26 states, (iii) the Federal District of Brasília, and (iv) cities (approximately 5,600 cities).

The beneficiary of tax benefits must be a registered company established in Brazil. This is

because tax authorities grant the benefit to the federal, state, or city taxpayer number of the corporate taxpayer, according to the grantor authority. Cumulative benefits at federal, state, and city levels are possible.

Brazil is an important recipient of foreign investments with a large manufacturing and technological industry. For this reason, the federal, state, and city authorities adopt tax benefits as part of an overall economic development policy for regional or industry-specific incentives. Such benefits are based on exemption, reduction, or deferment of federal, state, and city taxes, sometimes combined with free land, construction leases, and financial support with favorable interest rates and/or grace periods.

Brazilian state and city governments, in particular, offer important tax benefits seeking to dispute and attract investments. State and city authorities may enter into bilateral agreements with companies to formalize such benefits, unless there is a general legislation indicating the procedures for investors to qualify for the benefits.

At the state level, the National Council of Fiscal Policy (CONFAZ in Portuguese its abbreviation), a body composed by the State Treasury Secretaries, publishes national protocols on ICMS tax incentives that each state of the Federation may grant. ICMS is one of the most important taxes in Brazil in terms of collection, and this national guidance seeks to avoid investment disputes among states. Investors must confirm whether a given State ICMS tax incentive has been approved by CONFAZ.

Fostering Exports

Exports of goods and services are encouraged and subject to certain tax benefits. For goods, tax benefits are available for export production and take the form of customs rules (see specifics in the topic about Beneficial Customs Regimes), export tax exemption for the most part, and credit, deferment, or suspension of indirect taxes levied on taxable items that will compose finished goods (destined to exports). The support for export

sales can also take the form of specific credit lines at beneficial rates.

For services, tax benefits are not subject to (i) federal turnover taxation provided that there is inflow of cash for payment and (ii) city service taxation if the economic benefits derived from the service are seen out of Brazil.

Special Zones

Investments may benefit from tax incentives if channeled to Brazil through free-trade zones within the North and Northern and part of the Mid-West regions of Brazil, pursuant to approved projects. Companies gain from exemptions or reductions of federal taxes on (i) income, (ii) turnover, and (iii) sales of tangibles: the corporate income tax, turnover taxes (PIS/COFINS), import duties, tax on imported goods and on manufactured ones (IPI), and the state VAT tax (ICMS).

The Manaus Free Trade Zone 75% of reduction of IRPJ for 10 years (currently limited to FY2073), up to 88% reduction of the federal Import tax (II), exemption of the federal IPI tax if goods are locally consumed and/or produced, reduced State ICMS tax rate, exemption of the federal PIS and COFINS taxes when importing into the Manaus Free Trade Zone, no federal PIS/COFINS taxes on imported raw, intermediate, and packing materials when buyer and supplier are located within the Manays Free Trade Zone, and on inputs for local manufacturing processes; limited PIS/COFINS (3.65%) on sales of locally produced goods.

Superintendence for the Development of Amazônia (SUDAM) and Northeast (SUDENE) SUDAM and SUDENE are independent agencies of the federal government. They provide reduction or exemption of corporate income taxes for projects within the North/Northern states, including the Manau Free Trade Zone. They allow a 75% reduction of the corporate income tax on investments for a period of 10 years (until 2073).

Federal Special Customs Regimes

These regimes provide for exemption, suspension, and deferment of federal import taxation. State legislation on imports may be harmonized with the federal equivalent, and the particular rules must be assessed.

RECAP This special regime for acquisition of capital assets for export companies is provided by federal law 11.196/2005. It suspends the turn-over taxation on the acquisition and/or imports of equipment according to the tariff codes indicated in the regulations. The suspension may last 3 years as of the moment the regime has been approved.

Drawback This regime was originally introduced by law-decree 37/1966. It has been subject to a number of regulatory modifications, and the regime has evolved and improved since then. The regime involves various benefits. The payment of relevant import taxes – Import tax (II), tax on imported goods and on manufactured ones (IPI), state VAT tax (ICMS), and the Merchant Marine Renewal Tax on freight (AFRRM) – can be partially or totally suspended on goods that will be re-exported after being transformed, repaired, or manufactured locally. The amount of exemption depends on the level of local manufacturing (alternatively, instead of being suspended, taxes may be paid upon the import and further reimbursed after re-exportation). Imported items must be limited to 40% of exported goods. ICMS conditions may vary depending on the legislation of the different states.

Temporary Admission This customs regime under Federal Revenue Regulation #1600/2015 (“IN RFB 2015/2015”) allows certain imported goods to enter and remain in Brazil under a temporary import procedure without payment of import taxes. Goods remain in the country for a determined temporary period of time according to their specific purposes and conditions indicated in the regulations (e.g., lease transactions, exhibitions, commercial, cultural, and sports events,

etc.). Under this regime, import taxes are suspended and not due at the return of the goods if all conditions upon-agreed are observed.

RECOF This regime is based on law-decree 37/1996, federal law 10.833/2003, federal law 10.865/2004, Federal Revenue regulation #1291/2012, and further amendments. Under this regime, imported raw materials and inputs, mainly parts for aircrafts, vehicles, and electronics, may be exempt from federal taxes (II, IPI, and PIS/COFINS) and state tax (ICMS). Exemption is conditioned to exports of the finished goods or their sale in the domestic market.

RECOM According to Sec. 381 of the Customs regs, this regime is for imports of inputs (materials and components) to be used in manufacturing of products ranked from tariff codes 8701 to 8705 (e.g., spare parts and subassemblies as motors, components, and accessories). It allows for the deferment of PIS, COFINS, and IPI on imports until the moment the finished vehicle is sold by the wholeseller.

REPETRO This is a custom regime under the terms of decree 6.759/2009. It has been designed for imports and exports of goods used in the exploration of oil and natural gas deposits. The regime allows the importation of raw materials and the parts and pieces that are to be used in the production of goods which are to be re-exported (drawback) without IPI, PIS, and COFINS. Another benefit is the exemption from IPI, PIS, and COFINS on importation of foreign equipment for a temporary stay. Companies holding authorization for exploring oil and natural gas deposits may benefit from REPETRO.

REPEX Under the terms of law-decree 37/1966 and further amendments, including the enactment of federal law 10.865/2004, this regime allows for the suspension of tax payments and imports of crude oil and its derivatives when they are exported or re-exported. This program is dedicated to firms that are allowed to import and export oil products by the National Petroleum Agency (ANP).

REINTEGRA Under the terms of decrees #8.543/2015 and #8.415/2015 and federal laws #12.546/2011 and #13.043/2014, this is a federal tax regime created to provide incentives to exports of manufactured goods. It provides export companies with the refund in the form of a tax credit of 1% of the total amount of revenues derived from the export of goods. This amount shall be offset with federal taxes or reimbursed. This incentive is not applicable to trading companies and to goods which were previously imported. It will be enforced through December 2013 and could be extended by the government.

REIDI This special regime of incentives for the development of infrastructure was introduced by federal law #11.488/2007. It provides suspension of PIS and COFINS on goods and services in the case of projects of infrastructure: transports, ports, power, irrigation, etc. The benefit is granted for 5 years, after which a new application project must be presented.

Federal Import Tax Exemption for Lack of Similar Product in Domestic Market Federal decree #6759/2009 provides that imports of goods not available in the domestic market may be subject to a zero-rated import tax. This procedure is subject to an approval process. Importers of records must follow the customs regulations to produce evidence with respect to the applicable tariff code.

Federal Corporate Income Tax Benefit for Workers Nourishment Program (PAT in Its Portuguese Abbreviation) Under federal law 6321/1976 (and further modifications), companies may reduce their corporate income tax due if they qualify for the Workers Nourishment Program aimed at improving the quality of nutrition of employees. The combined maximum amount that may be deducted from the corporate income tax is 4% of the tax due.

Federal Incentive for Cinematographic and Audiovisual Productions and Co-productions The Audiovisual federal law #8.685/1993 provides rules on investments in

audiovisual and cinematographic productions and co-productions. Individuals may invest part of its income tax in such projects up to the limit of 3% of the tax due, while companies are subject to a 1% cap. These are deductible expenses, and projects must be approved by federal authorities from the Ministries of Culture and Economy. For sponsorship of and donations to projects approved by federal authorities from the Cinema National Agency (ANCINE), the deduction limits are 6% for individuals and 4% for companies of the income tax due.

Federal Incentive for Sports The sports federal law # 11.438/2006 (and further modifications) provides tax incentives for the development of sports at different levels, including Olympic and Paralympic sports. Individuals may deduct up to 6% of the income tax due. Companies may deduct up to 1% of the income tax due. Sponsorship and donations by individuals and companies in favor of sports projects are subject to approval by federal authorities.

Federal Corporate Income Tax Benefit for Cultural and Artistic Projects Companies may reduce their corporate income tax based on approved cultural and artistic projects under the terms of federal 8313/1991. The amount that may be deducted from the corporate income tax applicable to these incentives is 4% of the income tax due. Individuals may also benefit from this legislation, and the cap is 6% in their case.

Federal Incentive for Semi-conductors and Digital TV (PADIS and PADTV) This tax incentive under federal law #11.484/2007 (and further modifications) has focused on the tech development of the semi-conductor industry ("PADIS") and of equipment for Digital TV (PADTV). The regime provides income tax exemption and zero-rated levies of turnover taxes (PIS/COFINS), tax on imported and manufactured goods (IPI) and on contribution tax on payments for services and technology (CIDE), and import tax on fixed assets (machinery and equipment).

Federal Incentive for Information and Technology

The Information and Technology (federal laws #8.248/91 and 8.387/91 and further modifications) grant tax incentives to increase competition and technical know-how of resident companies that produce information and tech goods, automation tech and telecom goods. Companies must invest between 4% and 4.35% of the annual revenues generated by eligible products in R&D. They may benefit from an IPI (tax on imported and manufactured goods) 80–95% reduction. The benefits are extended to the State VAT (ICMS) reduction (applicable to some states) and reduction on the imports of inputs (applicable to some states) and credit lines.

There are specific federal incentive programs that provide low-cost financing through the Brazilian Social and Economic Development Bank (BNDES), one of the largest of its kind in the world. This form of incentive may be associated with industrial projects that may also benefit from tax benefits.

Federal Incentive for Innovation Federal law 10.973/2004 provides incentives for scientific and tech research for the corporate industry. This is achieved through the distribution of financial incentives. The Federal Union grants financial, material, and infra resources to universities and research foundations. Companies have to enter into a partnership agreement for the development of tech with those institutions to benefit.

Federal Incentive for R&D Federal law 11.196/2005 provides companies with investments in Research & Development activities may qualify for the following incentives: corporate income tax deduction from 20.4% up to 34% for expenditures on R&D, IPI (tax on imported and manufactured goods) 50% reduction on the acquisition of machinery and equipment to be employed in R&D, accelerated depreciation and amortization (of capitalized R&D expenses and certain intangibles) – R&D expenses are entirely deductible for Brazilian income tax purposes.

State of São Paulo

In view of the fact that 26 states and a substantial number of cities within Brazil's 5,600 municipal jurisdictions may offer tax benefits, we will briefly comment on some relevant State VAT tax benefits of a Brazilian southern state with a relevant manufacturing and information and technology activity.

Acquisition of Machinery and Equipment for Fixed Assets

Under section 29 of the ICMS Tax Regulations of the State of São Paulo, this benefit provides (i) the ICMS suspension in the case of imports of assets without similar ones in the domestic market and (ii) full refund in one installment of the ICMS tax due if these fixed assets are acquired from a state resident manufacturer.

Accumulated ICMS Credit in Investment Projects

This benefit allows the use of such credits for the acquisition of goods to be used in projects of investment, say modernization and expansion of industrial plants, construction of new plants, development of new products, and expansion of businesses within the State.

7% ICMS Credit on Interstate Sales for Information and Technology Assets

This benefit is provided by state decree 51.624/07. If sales are within the state, taxpayers may choose the credit equivalent to the tax burden imposed on this transaction. Information and Technology products listed in Treasury Resolution 14/2013 of the State of São Paulo are subject to tax base reduction in such a way that the corresponding tax burden be 12% (art 27, attachment II, of the State Regs). There is also suspension or deferment of the ICMS on imports of parts, inputs, and raw materials if the acquisition is undertaken by a manufacturer of information and technology products listed in federal law #8.248/1991.

Summary

The overall corporate direct, indirect, and payroll tax burden in Brazil is heavy, and the rules are rather complex. Tax benefits have become crucial

as a form of tax policy for the Brazilian governments at different levels, say federal, state, and city, to correct gaps in the legislation and foster investments.

Tax incentives provide opportunities for resident and nonresident investors to create and accumulate capital stock in the country. So to speak, through tax breaks, investors have legal access to planning that will lead to cost reductions associated with doing business in different sectors of the Brazilian economy (technology and infrastructure above all) and a quicker recovery of expenditures.

The outcome is job creation, training, industrial investments in plants, transfer of know-how and technology, development of exports infra, and gains for specific industries such as culture, sports, and audiovisual.

To implement this kind of tax and legal framework, companies (and individuals) have the option to merely channel part of their taxes to specific projects of interest that are available in the country.

Tax Citizenship

Rute Abreu¹ and Henrique Formigoni²

¹Instituto Politécnico da Guarda, UDI-IPG, CICF-IPCA, CISED-IPV, Guarda, Portugal

²Universidade Presbiteriana Mackenzie, Sao Paulo, Brazil

Synonyms

[Tax awareness](#); [Tax consciousness](#); [Tax culture](#); [Tax education](#)

Definition

Tax citizenship is the commitment of individuals and organizations within the community where they are located, in particular, and the society, in general, to exercise the correct and the ethical use of their rights and taxation obligations based on the public trust of fair and transparent public spending as well as the reciprocity of the participating public agencies. Carrasco (2010) has proposed a definition of tax citizenship, and the authors have adapted it.

Transformation of Tax Citizenship

The transformation of tax involves new concepts and definitions of citizenship (Lister 2003) that requires the adaptive focus. Tax citizenship is a learning process that never ends. For the state to develop its institutional activities in the areas of infrastructure, education, health, social security, and others, provided for in the federal constitution, it is necessary to have sufficient financial resources, which are obtained mainly through the collection of taxes. However, many taxpayers are looking for ways to avoid or reduce the payment of taxes due, whether through legal or illegal means. In this case, the problem lies in the situation of nonpayment or reduction of the tax due illegally, where tax evasion occurs.

Tax Breaks

- [Tax Benefits in Brazil](#)
- [Tax Incentives from a Brazilian Perspective](#)

The OECD (2015, p. 3) argues in favor of the culture of tax compliance that is based on “rights and responsibilities, and in which citizens see paying taxes as an integral part of their relationship with the government. Across the globe, governments and tax administrations are the developing innovative taxpayer education programs to inform and engage both current and future taxpayers.” Thus, the concept of tax compliance is built on a legal decision made under context of uncertainty. Indeed, taxpayers face the option of either accepting the law and paying taxes honestly or cheating and taking the risk of being caught and fined. It is assumed that the level of compliance is related to the personal income levels and its tax rate, penalty rates, and audit process, respectively, that determine the citizen’s decisions to comply or not to comply in relation to taxes (Allingham and Sandmo 1972).

In the context of human behaviour, there is the need to understand the tax awareness or tax the consciousness, because the citizen must understand the surroundings of the reality which is immerse and how to react to this reality as Nurlis (2015) argues. Furthermore, in the tax awareness, the citizen must balance her or his self-awareness, self-fellow, and their past, present, and future possibilities of the decisions that must be made. Also, the tax awareness means that the taxpayer wants to pay taxes, despite the disadvantaged to do it, due to the tax process collection. For all these reasons, the taxpayer felt the compulsion to fulfil this as an obligation that must be done. Nevertheless, tax awareness is often an obstacle in the problem of collecting taxes from the society.

Many taxpayers do not know the concrete form of compensation for the tax they have paid. This happens due to the agency theory and, in particular, with moral hazard problem as a result of the fact that the taxpayer wants to enjoy the benefits arising from public policies; however, he or she is not willing to contribute to his or her fair share to the costs of their adoption and implementation (Varvarigos 2017).

The taxpayer knows that are social costs. They are the amount of transfer of resources from households and businesses to the government

by imposition of taxes, which generates three different types of costs, such as: efficiency, administrative, and compliance. Tran-Nam et al. (2000) define efficiency costs as deadweight losses or excess burdens arising from tax-induced changes in relative prices, distort consumer and producer choices, and cause losses in overall output. Also, the administrative costs are the government costs of collecting taxes. And the compliance costs are the resource value expended by the taxpayer in meeting his or her tax obligations. The sum of administrative and compliance costs is often referred to as the operating costs of a tax system.

Additionally, Dowling (2014) defines tax minimization as looking for ways to minimize the tax bill in relation to transactions usually undertaken. Thus, the citizen is focus on efficiency costs as deadweight losses or excess burdens, arising from tax-induced changes in relative prices, distort consumer and producer choices, and cause losses in overall output (Tran-Nam et al. 2000). These cost concepts demand to assess the psychic costs because they are the nonpecuniary costs incurred by those whose fraudulent behavior is exposed, such as costs that could comprise social stigma, reputation damage, shame, and others (Varvarigos 2017).

Thus, the importance of the concept of tax citizenship becomes relevant. Through one of its attributes, transparency in the state’s financial activity, it can provide greater security to the taxpayer and result in a citizen who participates in a more spontaneous and collectivist way in public affairs (Nasar 2015). As Taxes for Expats (2021) defines, the citizenship-based taxation is related to all citizens of one country that are taxed under the same personal income tax system, regardless of whether they live in the country or abroad. Also, tax citizenship is related to tax arbitrage because it encompasses planning devices that exploit differences in tax jurisdictions.

One example where there are differences in the State tax-planning opportunities for individuals as taxpayers is the federal-state tax-base, which is the conformity that may reduce loss from tax arbitrage by minimizing differences (Mason 2013). Another example that the Greenback Expat Tax Services (2020) defines is the

residency-based taxation, which it is related with the country where the citizen life. So, the citizen pays taxes, because he or she lives in this country and it is subject to specific taxes and to his or her income. Also, the Greenback Expat Tax Services explains that nonresidents are only subject to taxation of income derived from the country. It is relevant to define that each country specifies a tax resident characteristic because it changes widely, and sometimes the tax rates differ for residents and nonresidents.

Indeed, the tax resident is defined under the specific domestic tax laws of each country jurisdiction. There might be situations where a person qualifies as a tax resident under the tax residence rules of more than one jurisdiction and therefore is a tax resident in more than one jurisdiction. For the purposes of the paying taxes, financial institutions must ensure that account holders or controlling persons disclose all tax residences in the required self-certification. For the purposes of the paying personal taxes, the account holder or controlling person must disclose all its tax residences in the required self-certification. Kindly note that the mere right to reside in each jurisdiction (on permanent or temporary basis) or the fact of holding citizenship of a given jurisdiction does not automatically mean that a person shall be considered a tax resident in such a jurisdiction or that, upon obtaining residency or citizenship, the tax residency is extinguished in the former jurisdiction(s) of tax residence. Tax residency rules are applicable in jurisdictions that are committed to automatically exchanging information under the CRS, as provided to the OECD Secretariat by those jurisdictions (OECD 2021).

It is relevant to understand that taxation is an economic policy instrument that generates tax revenues, which are an important source of financial resources with which governments finance the adoption of policies, such as the provision of public services and infrastructure, that increase productivity and, thus, redistribution of wealth (Varvarigos 2017). The imposition of taxes

represents a transfer of resources from households and businesses to the government (Tran-Nam et al. 2000).

Undeniably, the tax citizenship is related with tax morale or tax mentality, since it is supported on psychological costs of tax evasion (Molero and Pujol 2012). Nerré (2008, p. 155) “includes all attitudes and also all patterns of behavior which the tax-paying citizens hold against (or with?) the tax and the state”. Therefore, Torgler and Werner (2005, p. 460) take a wider perspective, where they define tax morale as the “intrinsic motivation to pay taxes.”

In addition, tax citizenship is based on the tax payment, from the CSR perspective, which can be considered a clear measure of the direct financial contribution a firm makes to an elected government (Dowling 2014). This scenario has been possible to see at the Transparency Portal of the Minas Gerais State (2021) that argues the tax citizenship is the exercise, by the citizen, of the right to be adequately informed about the origin and application of public resources, overseeing the transformation of taxes paid into quality works and services. In this sense, tax citizenship requires awareness of the social function of the tax, the role of the state in collecting taxes, the duty to pay them when due, and the need to control their correct payment (Folloni and Bubniak 2017).

However, the tax culture is inherent to a country, and, by one side, it emerges coined by the tradition of taxation (e.g. an accentuation of [in]direct taxes) and, by another side, by the interaction of cultural values like ‘honesty’, ‘justice’ or a ‘sense of duty’. A country-specific tax culture is the entirety of all relevant formal and informal institutions connected with the national tax system and its practical execution, which are historically embedded within the country’s culture, including the dependencies and ties caused by their ongoing interaction (Nerré 2008).

In this context, the tax education concept is an innovative process that creates awareness among citizens of the social function of taxes, that it has been argued by Lindholm (1967). Little by little,

one has found out and learned why it is more important to convince rather than apply coercive actions. Citizen involvement is concerned with the payment of taxes and in taking care of public properties (Brenes 2011).

Brenes (2011) argues, too, that civic tax is a broad concept that involves not only the passive attitude of complying with the right to vote, with the payment of taxes, but rather goes beyond in the sense that each citizen must be responsible for the public property that has been assigned to him, of which he makes use in his social environment. They should be watchful to ensure that public revenues be invested in the items for which they were established.

Tax avoidance is defined as transactions entered solely for the purpose of generating a tax benefit. As a legal activity, it exposes the ambiguity of what is meant by the simple statement that companies should “abide by the law.” Some common practices for tax avoidance are offshore tax sheltering, accounting manipulation, and legal obfuscation (Dowling 2014).

Tax agencies are aware of the tax evasion that it is very difficult to shift, and it is against the tax citizenship (Varvarigos 2017). Thus, citizens must understand that illegal practices will increase tax obligations in order to found information about income and wealth. These efforts demand strong tax education and the tax awareness that will lead to fiscal civics which is a broad concept that involves not only the passive attitude of fulfilling the right to vote, with the payment of taxes, but goes further in the sense that each citizen must be responsible for the property which he has been assigned or which he makes use of in his social environment; The citizens must be vigilant to ensure that public revenues are invested in items for which they are established in Annual Budget State. So, if someone manages to reach a fiscally committed citizen, the government will have to invest less and less in those expenses that currently arise because of serious problems in citizen behavior and can do more through infrastructure, education, and health (Brenes 2011).

Summary

Tax citizenship has been promoted, in several countries, with different tax culture and systems by politics, researchers, organizations, experts, national authorities, and citizens. However, even though efficient and effective immediate results have not been achieved, each government has invested in tax citizenship and, especially, has improved its communication with citizens, in general, and with taxpayers, in particular.

A constant publication of rules and codes of law related to the tax system allows the tax agencies to disseminate an open and free source of information for all citizens, which is important to prevent tax evasion. These citizenship strategies demand that each government must act to increase taxpayers’ fiscal awareness, which improved the financial balance of the taxation budget, and, at the same time, increase the consciousness about the citizenship.

For one side, the state needs resources for the development of its constitutional activities, which are practically obtained through taxes collected from taxpayers. And the Government knows to be more efficient on collection of taxes must dialogue with taxpayers about tax issues, instead of imposing penalties for not paying taxes.

For the other side, the citizens, in general, and the taxpayers, in particular, want to pay the minimum taxes possible due to the income of its economic activities. All over the world, tax authorities promoted new reforms instead of negative sanctions, fines, and penalties to non-compliance of taxes.

Lastly, the citizens must make a commitment with the society, based on the accurate and legal tax system, an ethical right, and customs in relation to tax culture, mandatory obligations that must diminish the resistance to pay taxes, and increasing the merits of citizenship arguments. Certainly, the citizens must be confident with impartial and transparent public expenditure, as well as the trade-off of the tax authorities to collect taxes. However, the consensus must be achieved with progression of the scientific knowledge.

Definition/Description

Article 1 of the GATT/WTO Agreement on Subsidies and Countervailing Measures: defines subsidy as a financial contribution that confers a benefit. The contribution involves direct transfers of funds, grants, loans, equity, or potential revenue otherwise due but forgone in the form of tax incentives. Sanchez-Ugarte (1995) uses tax incentive interchangeably with subsidy and argues that both may be defined as a reduction in the tax rate, tax base, or tax liability granted if a specified action is taken by the selected beneficiary. In Brazil, the lack of a legal standard terminology definition has led a good part of the doctrine to refer to this backlog of economic drivers as tax benefits interchangeably with tax incentives (Elali, 2010). Broadly speaking, the so-called tax benefits or incentives may be grouped into different categories, such as tax subsidies, tax holidays, investment allowances, grants, tax credits, timing differences, and free economic zones.

Introduction

Brazil is one of the world’s most important recipients of foreign investments, with a large manufacturing and technological industry within its vast economy. At the same time, the overall corporate direct, indirect, and payroll tax burden

in Brazil has been steadily heavy grounded on rather complex rules.

To minimize the burden and foster domestic and inbound investments and exports, federal, state, and city authorities often grant tax incentives. This framework has become part of the overall economic development policy for regional or industry-specific incentives. This broad perspective raised the need of coordinated tax policy among the different units of the federation to prevent or mitigate disputes.

From the standpoint of authorities, tax incentives provide opportunities for resident and non-resident investors to create and accumulate capital stock. The experience of Brazil based on long-term grants associated with planning has led to cost reduction, quicker recovery of expenditures, job creation, training, industrial investments, transfer of know-how and technology, development of export infrastructure, and gains for specific industries.

The key drivers backing the complex network of tax incentives range from exemptions, rate and basis reductions, timing differences, tax holidays and subsidies to grants and special tax and customs regimes. Sometimes they may be combined with free land, construction leases, and financial support with favorable interest rates and/or grace periods. On granting the incentives, the authorities do so through federal, state, and city legislation and administrative regulations enacted by federal, state, and city revenue services. The use of formal legislation increases transparency.

Both resident and nonresident investors (through local subsidiaries) may request tax benefits in the form of incentives. They are granted to the federal, state, and/or city taxpayer numbers of the resident beneficiaries. Cumulative benefits at federal, state, and city levels are common, eventually connected depending on the objectives of the incentive.

At the state level, the National Council of Fiscal Policy (CONFAZ in its Portuguese abbreviation), a body composed by the State Treasury Secretaries, publishes national protocols on the State VAT tax incentives (known as ICMS) that each state may grant. As States have their own set of ICMS tax rules, the CONFAZ protocols

constitute a binding national guidance to avoid investment disputes among states. At the city level, to ensure national harmonization and minimization of city conflicts, the federal legislation provides guidance for cities to comply with.

Analysis

• Fostering Exports

Exports of goods and services are encouraged. For goods, tax benefits are available for export production and take the form of customs rules, export tax exemption for the most part, and credit, deferment, or suspension of indirect taxes levied on taxable items that will compose finished goods (destined to exports). The support for export sales can also take the form of credit lines at beneficial rates. For services, tax benefits are not subject to (i) federal turnover taxation provided according to certain conditions.

Special Zones

Investments may benefit from tax incentives if channeled to Brazil through free-trade zones within the North and Northern and (part of) the Mid-West regions of Brazil, pursuant to approved projects. Companies gain from exemptions or reduction of federal taxes on (i) income, (ii) turnover, and (iii) sales of tangibles: the corporate income tax, turnover taxes (PIS/COFINS), import duties, tax on imported goods and on manufactured ones (IPI), and the state VAT tax (ICMS).

The Manaus Free Trade Zone 75% of reduction of IRPJ for 10 years (currently limited to FY2073), up to 88% reduction of the federal Import tax (II), exemption of the federal IPI tax if goods are locally consumed and/or produced, reduced State ICMS tax rate, exemption of the federal PIS and COFINS taxes when importing into the Manaus Free Trade Zone, no federal PIS/COFINS taxes on imported raw, intermediate, and packing materials when buyer and supplier are located within the Manaus Free Trade Zone, and on inputs for local manufacturing processes.

Superintendence for the Development of Amazônia (SUDAM) and Northeast (SUDENE) SUDAM and SUDENE are independent agencies of the federal government. They provide reduction or exemption of corporate income taxes for projects within the North/Northern states, including the Manaus Free Trade Zone. They allow a 75% reduction of the corporate income tax on investments for a given period.

- **Federal Special Customs Regimes**

These regimes provide exemption, suspension, and deferment of federal import taxation. State legislation on imports may be harmonized with the federal equivalent.

RECAP This special regime for acquisition of capital assets for export companies is provided by federal law 11.196/2005. It suspends the turnover taxation on the acquisition and/or imports of equipment according to the tariff codes indicated in the regulations. The suspension may last 3 years as of the moment the regime has been approved.

Drawback This regime was originally introduced by law-decree 37/1966. It has been subject to a number of regulatory modifications and the regimes has evolved and improved since then. The regime involves various benefits. The payment of relevant import taxes – Import tax (II), tax on imported goods and on manufactured ones (IPI), state VAT tax (ICMS), and the Merchant Marine Renewal Tax on freight (AFRRM) – can be partially or totally suspended on goods that will be re-exported after being transformed, repaired, or manufactured locally. The amount of exemption depends on the level of local manufacturing (alternatively, instead of being suspended, taxes may be paid upon the import and further reimbursed after re-exportation). Imported items must be limited to 40% of exported goods. ICMS conditions may vary depending on the legislation of the different states.

Temporary Admission This customs regime under Federal Revenue Regulation #1600/2015

(“IN RFB 2015/2015”) allows certain imported goods to enter and remain in Brazil under a temporary import procedure without payment of import taxes. Goods remain in the country for a determined temporary period of time according to their specific purposes and conditions indicated in the regulations (e.g., lease transactions, exhibitions, commercial, cultural, and sports events, etc.). Under this regime, import taxes are suspended and not due at the return of the goods if all conditions upon-agreed are observed.

RECOF This regime is based on law-decree 37/1996, federal law 10.833/2003, federal law 10.865/2004, Federal Revenue regulation 1291/2012, and further amendments. Under this regime, imported raw materials and inputs, mainly parts for aircrafts, vehicles, and electronics, may be exempt from federal taxes (II, IPI, and PIS/COFINS) and state tax (ICMS). Exemption is conditioned to exports of the finished goods or their sale in the domestic market.

RECOM According to Sec. 381 of the Customs regs, this regime is for imports of inputs (materials and components) to be used in manufacturing of products ranked from tariff codes 8701 to 8705 (e.g., spare parts and subassemblies as motors, components, and accessories). It allows for the deferment of PIS, COFINS, and IPI on imports until the moment the finished vehicle is sold by the wholeseller.

REPETRO This is a custom regime under the terms of decree 6.759/2009. It has been designed for imports and exports of goods used in the exploration of oil and natural gas deposits. The regime allows the importation of raw materials and the parts and pieces that are to be used in the production of goods which are to be re-exported (drawback) without IPI, PIS, and COFINS. Another benefit is the exemption from IPI, PIS, and COFINS on importation of foreign equipment for a temporary stay. Companies holding authorization for exploring oil and natural gas deposits may benefit from REPETRO.

REPEX Under the terms of law-decree 37/1966 and further amendments, including the enactment of federal law 10.865/2004, this regime allows for the suspension of tax payments and imports of crude oil and its derivatives when they are exported or re-exported. This program is dedicated to firms that are allowed to import and export oil products by the National Petroleum Agency (ANP).

REINTEGRA Under the terms of decrees 8.543/2015 and 8.415/2015 and federal laws 12.546/2011 and 13.043/2014, this is a federal tax regime created to provide incentives to exports of manufactured goods. It provides export companies with the refund in the form of a tax credit of 1% of the total amount of revenues derived from the export of goods. This amount shall be offset with federal taxes or reimbursed. This incentive is not applicable to trading companies and to goods which were previously imported. It will be enforced through December 2013 and could be extended by the government.

REIDI This special regime of incentives for the development of infrastructure was introduced by federal law 11.488/2007. It provides suspension of PIS and COFINS on goods and services in the case of projects of infrastructure: transports, ports, power, irrigation, etc. The benefit is granted for 5 years, after which a new application project must be presented.

- Federal Import Tax Exemption for Lack of Similar Product in Domestic Market

Federal decree 6759/2009 provides that imports of goods not available in the domestic market may be subject to a zero-rated import tax. This procedure is subject to an approval process. Importers of records must follow the customs regulations to produce evidence with respect to the applicable tariff code.

- Federal Corporate Income Tax Benefit for Workers Nourishment Program (PAT in Its Portuguese Abbreviation)

Under federal law 6321/1976 (and further modifications) companies may reduce their corporate income tax due if they qualify for the Workers Nourishment Program aimed at improving the quality of nutrition of employees. The combined maximum amount that may be deducted from the corporate income tax is 4% of the tax due.

- Federal Incentive for Cinematographic and Audiovisual Productions and Co-productions

The Audiovisual federal law 8.685/1993 provides rules on investments in audiovisual and cinematographic productions and co-productions. Individuals may invest part of its income tax in such projects up to the limit of 3% of the tax due, while companies are subject to a 1% cap. These are deductible expenses, and projects must be approved by federal authorities from the Ministries of Culture and Economy. For sponsorship of and donations to projects approved by federal authorities from the Cinema National Agency (ANCINE), the deductions limits are 6% for individuals and 4% for companies of the income tax due.

- Federal Incentive for Sports

The sports federal law 11.438/2006 (and further modifications) provides tax incentives for the development of sports at different levels, including Olympic and Paralympic sports. Individuals may deduct up to 6% of the income tax due. Companies may deduct up to 1% of the income tax due. Sponsorship and donations by individuals and companies in favor of sports projects are subject to approval by federal authorities.

- Federal Corporate Income Tax Benefit for Cultural and Artistic Projects

Companies may reduce their corporate income tax based on approved cultural and artistic projects under the terms of federal 8313/1991. The amount that may be deducted from the corporate income tax applicable to these incentives is 4% of the income tax due. Individuals may also benefit from this legislation, and the cap is 6% in their case.

- Federal Incentive for Semi-conductors and Digital TV (PADIS and PADTV)

This tax incentive under federal law 11.484/2007 (and further modifications) has focused on the tech development of the semi-conductor industry (“PADIS”) and of equipment for Digital TV (PADTV). The regime provides income tax exemption and zero-rated levies of turnover taxes (PIS/COFINS), tax on imported and manufactured goods (IPI) and on contribution tax on payments for services and technology (CIDE), and import tax on fixed assets (machinery and equipment).

- Federal Incentive for Information and Technology

The Information and Technology (federal laws 8.248/91 and 8.387/91 and further modifications) grant tax incentives to increase competition and technical know-how of resident companies that produce information and tech goods, automation tech and telecom goods. Companies must invest between 4% and 4.35% of the annual revenues generated by eligible products in R&D. They may benefit from an IPI (tax on imported and manufactured goods) 80–95% reduction. The benefits are extended to the State VAT (ICMS) reduction (applicable to some states) and reduction on the imports of inputs (applicable to some states) and credit lines.

There are specific federal incentive programs that provide low-cost financing through the Brazilian Social and Economic Development Bank (BNDES), one of the largest of its kind in the world. This form of incentive may be associated with industrial projects that may also benefit from tax benefits.

- Federal Incentive for Innovation

Federal law 10.973/2004 provides incentives for scientific and tech research for the corporate industry. This is achieved through the distribution of financial incentives. The Federal Union grants financial, material, and infra resources to universities and research foundations. Companies have

to enter into a partnership agreement for the development of tech with those institutions to benefit.

- Federal Incentive for R&D

Federal law 11.196/2005 provides companies with investments in Research & Development activities may qualify for the following incentives: corporate income tax deduction from 20.4% up to 34% for expenditures on R&D, IPI (tax on imported and manufactured goods) 50% reduction on the acquisition of machinery and equipment to be employed in R&D, accelerated depreciation and amortization (of capitalized R&D expenses and certain intangibles) – R&D expenses are entirely deductible for Brazilian income tax purposes.

State of São Paulo

In view of the fact that 26 states and a substantial number of cities within Brazil’s 5,600 municipal jurisdictions may offer tax benefits, we will briefly comment on some relevant State VAT tax benefits of a Brazilian southern state with a relevant manufacturing and information and technology activity.

- Acquisition of Machinery and Equipment for Fixed Assets

Under section 29 of the ICMS Tax Regulations of the State of São Paulo, this benefit provides (i) the ICMS suspension in the case of imports of assets without similar ones in the domestic market and (ii) full refund in one installment of the ICMS tax due if these fixed assets are acquired from a state resident manufacturer.

- Accumulated ICMS Credit in Investment Projects

This benefit allows the use of such credits for the acquisition of goods to be used in projects of investment, say modernization and expansion of industrial plants, construction of new plants, development of new products, and expansion of businesses within the State.

- 7% ICMS Credit on Interstate Sales for Information and Technology Assets

This benefit is provided by state decree 51.624/07. If sales are within the state, taxpayers may choose the credit equivalent to the tax burden imposed on this transaction. Information and Technology products listed in Treasury Resolution 14/2013 of the State of São Paulo are subject to tax base reduction in such a way that the corresponding tax burden be 12% (art 27, attachment II, of the State Regs). There is also suspension or deferment of the ICMS on imports of parts, inputs, and raw material if the acquisition is undertaken by a manufacturer of information and technology products listed in federal law #8.248/1991.

Summary

Brazil's authorities adopt tax incentives to bolster regional development and encourage industry-specific development. In Brazil, the use of tax incentives based on long-term policies aims at increasing investments and capital stock in the country. Historically, this policy has secured job creation, training of labor work, solid industrial investments from local and foreign sources, development and transfer of substantial know-how and technology, supply of the domestic market based on local production, creation of exports infra to attend Latin American markets, and gains for top-notch industries.

The set of Brazilian legislation and amendments on tax incentives is fairly extensive. The following is a summary of some key federal rules that govern the sample of tax benefits discussed above: (i) Federal Laws – e.g., 13.043 (2014), 12.546 (2011), 11.488 (2007), 11.484 (2007), 11.438 (2006), 11.196 (2005), 10.973/2004, 10.865 (2004), 10.833 (2003), 8.685 (1999), 8.387 (1991), 8.313 (1991), 8.248 (1991), 6.321 (1976); (ii) Federal Decrees – e.g., 8.543 (2015), 8.415 (2015), 6.759/2009; (iii) Federal Law-Decree 37 (1966); (iv) Federal Revenue Acts 1600 (2015), 1291 (2012), and (v) Federal Customs Regulations, section 381. In view of the

wide range of state and city legislation on the matter, our analysis made reference to some of the state of São Paulo incentives (as the state is an important recipient of investments), derived from its ICMS tax regulations and State decree 51.624/07.

Background

Governments of all countries consciously seek to finance their policies and operations to fulfill their obligations and responsibilities to their citizens. A viable tool for seeking funding is taxation (Eragbhe and Aronmwan 2015).

To maximize their value, companies use various tax optimization strategies that generate tax savings, translating into better financial results (Zimmerman 1983). Considering this direct impact on tax collections, tax managers in

companies adopt various tax planning instruments, among which sometimes they can result in significant tax contingencies for the company (Tarazona et al. 2019).

This tax contingency risk started to demand greater transparency in financial statements, which became the motto of financial and tax accounting in recent years, with the Sarbanes-Oxley Act starting this movement in 2002 on the financial accounting side and a combination of new requirements of tax reporting and disclosures. Following corporate scandals over the past few decades (e.g., Enron, WorldCom, Tyco, Qwest), the financial accounting information provided to investors has come under greater scrutiny, with a particular focus on accounting for contingent liabilities (also known as reserves) due to concerns about the lack of transparency and perceived abuses in this area (Gupta et al. 2017).

Definition

The discussion on tax avoidance or evasion has gained increasing attention from business stakeholders and researchers in the recent years. The international literature calls the effects of tax avoidance or evasion as Unrecognized Tax Benefit (UTB), and there is a vast publication of academic papers on the subject (Wilde and Wilson 2018). The pioneering papers on tax avoidance are by Scholes et al. (1990) and Scholes and Wolfson (1992), who brought theory and empirical techniques from economics, finance, and accounting to better understand corporate tax evasion. However, researchers and shareholders must still understand about tax evasion from financial statements because companies typically do not disclose the details of their tax strategies (Simone et al. 2019).

Simone et al. (2019) state that there are three types of tax avoidance strategies: a permanent tax saving strategy (tax credit), a temporary tax saving strategy (accelerated tax depreciation), and a hybrid strategy (transfer of income between jurisdictions).

In the sphere of tax uncertainties, an initial study by Gleason and Mills (2011) uses tax

declaration data to show that before FIN 48, most companies did not voluntarily disclose these uncertainties (UTBs), which until then were classified as contingent tax reserves. Other studies examined whether companies changed the UTB before the effective date of FIN 48 (Blouin et al. 2010), whether companies managed profits using the tax reserve before or after FIN 48 (Simone et al. 2019).

Jacob et al. (2020) in their research identified that managers try to alleviate tax uncertainty with cheap sources of financing or available cash balance. In recent decades, companies have increasingly increased cash balances, and a key reason for this increase has been to provide preventive protection for uncertain future cash outflows (Opler et al. 1999; Bates et al. 2009). Also, Hanlon et al. (2017) in more recently study report that a significant part of a company's cash buffer is associated with uncertainty regarding its fiscal positions.

The implicit concern is that considerable cash balances are not invested or invested in low-return assets, effectively losing their use, such as in large capital investments (Jacob et al. 2020).

In this sense of cash accumulation, Law and Mills (2015) found that companies with financial constraints take a more aggressive stance in fiscal strategies, recording higher UTBs. Guenther et al. (2016) examine in the USA the relationship between tax evasion and tax uncertainty for firms with financial constraints and for firms without financial constraints and found that most tax evasion strategies are not uncertain, suggesting that only about 6 percent of the tax avoided is uncertain.

Dyrenge et al. (2019) also investigated the relationship between tax evasion and tax uncertainty, treating this uncertainty as the amount of tax benefits not recognized or recorded during the same period as tax evasion. The authors Dyrenge et al. (2019) found that tax evaders, that is, companies with a low effective tax rate, have significantly greater tax uncertainty than companies that have higher effective cash taxes. They also identified that the relationship between tax evasion and tax uncertainty is stronger for companies with frequent patent registrations and subsidiaries of tax

havens, with strategies in transfer pricing calculations and related to intangible assets (goodwill on acquisitions) (Markle and Shackelford 2012).

Regarding some differences in reporting, Dyrenge et al. (2019) report that the US multinational companies with subsidiaries located in tax havens have effective tax rates that are between 1.5 and 2.2 percentage points below the effective tax rates of US multinational companies without subsidiaries in places of refuge.

Watrin et al. (2019) identified that auditors are aware that companies may not make provisions for uncertain taxes, and these professionals (auditors) can still advise with more conservative tax strategies and can take more conservative positions when they have also provided advice to the audited company, since aggressive tax positions could lead to a review of its audit responsibility (Watrin et al. 2019). The auditor can use the knowledge gained during the audit to provide advice on tax planning, which can result in aggressive tax strategies (Hogan and Noga 2015).

Due to this exchange of knowledge from the audit department to the tax department, the auditor is in an excellent position to provide advice on tax savings (Gleason and Mills 2011). However, aggressive tax planning increases the risk of tax litigation and more tax risk, which can result in financial problems, restatements, and auditor liability, so auditors who provide tax services may also prefer less aggressive tax planning if there are uncertainties (Watrin et al. 2019).

International Accounting Perspective

A recent phenomenon to be studied is the scrutiny of the level of taxes on profits paid by companies (Whiting 2006). Firms often attract adverse attention due to the perceived discrepancy between the level of reported accounting earnings and the associated levels of taxable earnings and hence the level of taxes payable (Uncut 2010) and (Public Accounts Committee 2012). The review reflects concerns about the use of tax avoidance techniques and the perceived consequences on government revenue levels or increased levels of

taxation on other groups of taxpayers (Hasseldine et al. 2012).

Emphasizing the importance of accounting and tax differences, large American companies were asked to present to the Internal Revenue Service (IRS) a reconciliation of taxable income and financial accounting result since 2004 (Boynton and Mills 2004).

Differences can also arise from earnings management. This is more likely to represent aggressiveness in financial accounting reporting (Hanlon and Slemrod 2009); however, companies may be willing to pay taxes on management earnings as a sign of credibility (Erickson et al. 2004).

The rivalry between the tax authority and corporate taxpayers is increasing, as these (corporate taxpayers) are more aggressive with the approach of reducing taxable profits, while the tax authority is looking for ways to increase its collection (Salihu et al. 2013).

Tax savings are usually obtained from loopholes in tax regimes that are not intended to provide taxpayers with tax advantages (Bai et al. 2017). Thus, the concern of regulators with greater transparency is driven by the possible impact of tax contingency, considering the greater risk in companies immersed in complex tax planning structures, as in these cases, a tax performance can have a strong economic and financial impact on companies (Tarazona et al. 2019). The same authors also point out that imprecise and incorrect disclosures can affect the decision-making process of stakeholders, including the tax inspector; because of these impacts, companies must be very careful in the process of estimating and disclosing their actual contingent liabilities with regarding taxes on profit. If the company concludes that the tax authority is unlikely to accept the uncertain tax treatment, the effect of tax uncertainty must be reflected in determining the tax base (ICPC 22 2018).

American Accounting Perspective

The interpretation FIN 48, published in June 2006 by the FASB, began in 2007. Also, the purpose of this US accounting standard was to increase the

transparency of interpretations, relevance, and comparability with the uncertain tax positions of companies, all related to income taxes (Gleason et al. 2018). Indeed, FIN 48 was introduced to improve the relevance and comparability of financial statements in their income tax reporting and to provide more information in the financial statements about uncertainty in income tax assets and liabilities (FASB 2006). The entry of FIN 48 was considered one of the most impactful accounting changes after the 2000s (Mills et al. 2010).

A highlight of the interpretation is related to the disclosure of strategic information related to taxes; the main disclosures are techniques adopted to reduce taxes due, criteria for the deferral of taxes, justification for changes in the expectations of realization of deferred taxes, as well as the benefits related to tax planning, focusing mainly on business combinations.

Uncertain tax benefits must be recognized as an accounting reserve; this reserve is necessary when a company is unsure whether the tax position and its treatment of recognition in tax returns will be accepted by the tax authority; therefore, it will lead to new tax payments when submitted to a tax audit (Lisowsky et al. 2013).

Tax laws and regulations are subject to interpretations by taxpayers, which in an inspection procedure may not be the same interpretations of the inspection agent (Frischmann et al. 2008). A common example in these cases is the goodwill or goodwill in business combinations that generate uncertainties for companies and inspectors in the measurement and fiscal accounting recognition (Lopes 2012).

Summary

Tax uncertainties are common in the financial statements because there are always a risk between the interpretation of the facts by the tax authorities and the management of the company. Sometimes management uses the judgment in the financial statements to promote a better understanding by the stakeholders. However, it is not the same view of tax authorities, causing a risk when it comes a book-tax difference.

Introduction

There are several theories that can contribute to knowledge about the most important governance body of the firm – the board of directors. However, the emergence of alternative theories, opposed in some points, has contributed even more to the broad debate on corporate governance (Garner et al. 2017). The three dominant theoretical paradigms in research on corporate governance are (Nicholson and Kiel 2007): the Agency Theory (Jensen and Meckling 1976; Fama and Jensen 1983), the Stewardship Theory (Donaldson 1990; Donaldson and Davis 1991, 1994), and the Resources and Capabilities Theory (Zald 1969; Pfeffer 1972; Pfeffer and Salancik 1978). These three theories recognize the different main roles of the board of directors, in such a way that the optimal configuration of the board differs depending on the theoretical approach adopted. However, a common aspect of all of them is their emphasis on clarifying the relationship between the different characteristics of boards of directors and company performance. In this sense, the academic literature developed in recent years concludes that the relationship between the board of directors and company performance is too complex to be explained unilaterally by a single theory (Garner et al. 2017; Li et al. 2018). These theories have helped clarify the functions carried out by the board to contribute to the better performance of organizations (Åberg et al. 2019).

The Agency Theory

The Agency Theory has been the dominant theoretical approach in research on boards of directors (Åberg et al. 2019; Li et al. 2018), especially in the field of corporate finance. This theory refers to the alignment of interests between owners and managers (Jensen and Meckling 1976; Fama 1980; Fama and Jensen 1983). The starting point is the conflict of interest between those who finance the company – its owners and those who manage funds –and the managers (Fama and Jensen 1983). Adam Smith (1776) first documented the

recognition of this conflict, although it was not until the beginning of the last century, with the seminal work of Berle and Means (1932), when it was heard for the first time about the effective separation between company ownership and company control. This separation implies that managers have more knowledge and experience of the company than owners; the former can therefore act at the expense of the latter. The combination of these information asymmetries, the different “risk profiles, and the inability of managers to diversify their risk” (Boyd et al. 2011, p. 1.893) can lead to their opportunistic behavior. Company owners need to incur agency costs to supervise the behavior of managers in order to reduce the divergence of interests between both parties. “Jensen and Meckling (1976), who argue that agency costs are an inevitable part of the ownership-management relationship, formalize this hypothesis in a mathematical model” (Nicholson and Kiel 2007, p. 587). The agency problem has been later discussed in studies of great importance (see, e.g., Eisenhardt 1989; Fama 1980; Fama and Jensen 1983,). These studies conclude that the self-interest of managers can be detected through remuneration or other types of gratifications, and in other types of motivations more difficult to identify, such as the pursuit of growth at the expense of economic benefit (Stano 1976).

From this perspective, corporate governance must establish control and supervision mechanisms that allow an effective protection of shareholders from possible opportunistic behavior by the management team (Li et al. 2018; Pearce and Zahra 1992). The Agency Theory, widely accepted in the political-business sphere, has resulted in corporate governance recommendations that focus on the supervisory role of boards, advocating, in general for boards of an intermediate size, with a majority of independent directors and with an effective separation of the figures of CEO and board chairperson (Andrés and Santamaría 2018; Cuomo et al. 2016). These characteristics will allow the board to effectively supervise managerial action. As a result of this supervisory role, there will be fewer opportunities for managers to act in their own interest at the

expense of the interests of the owners, there will be less agency costs, and, therefore, shareholders will receive higher returns or profit increases. In summary, a more efficient supervisory function is associated with lower agency costs and, consequently, with better business performance (Garner et al. 2017).

The impact of the Agency Theory in research on corporate governance can be seen in the large number of studies that have examined the impact of board structure on company performance; the results of these studies are contradictory and inconclusive (Aguilera et al. 2016; Garner et al. 2017).

This theory has been widely developed “in the Anglo-American context and, consequently, highly criticized for its limited applicability” Boyd et al. 2011, p. to other institutional contexts (Aguilera et al. 2008; Aguilera et al. 2016). In response to this criticism, new branches of this theory have been developed, such as the Social Agency Theory (Wiseman et al. 2012) and the Theory of Behavioral Agency (Wiseman and Gomez-Mejia 1998).

The Stewardship Theory

The Stewardship Theory (Donaldson and Davis 1991) emerged from the fields of sociology and psychology. Contrary to the Agency Theory, which proposes an economic view of managers, the Stewardship Theory offers a psychosocial view of corporate governance and establishes that relationships within the company are governed by behavioral guidelines and are not led by the agent-principal conflict of interest (Keay 2017). It considers company managers to be people of trust, committed to the organization and, therefore, good administrators of the resources that the company entrusts to them (Martin and Butler 2017). According to this theory, the gain derived from this pro-organizational behavior is greater than that derived from an individualistic behavior that only pursues self-interest. From this approach, the interests of managers would be aligned with those of the organization (Li et al. 2018), and, therefore, although it is true

that managers can try to maximize their personal utility, this theory proposes that the interest of the manager-steward will not be different from the collective interests. Given that the main objective of the company is to maximize the wealth of its owners, the management team, under this steward behavior, will pursue the same objective (Krause et al. 2014). In the event the interests of different participants in the company are not the same, the management team will take decisions aimed at serving the best general interest of the organization (Miller et al. 2008) as, in doing so, it maximizes its own utility function (Davis et al. 1997). The behavior of the steward is highly oriented toward cooperation, and its motivation responds more to intrinsic than extrinsic questions. Therefore, the server adds value not only through its pro-organizational behavior but also by internalizing the objectives of the organization in its individual cognitive structures (Boyd et al. 2011).

Davis et al. (1997) present a broad description of this theoretical approach (Martin and Butler 2017). These authors conceive corporate governance as the simultaneous result of two perspectives, psychological or behavioral in terms of human behavior and the situation regarding the business organization model. Consequently, the resulting governance structure has its origin not only in the behavioral factors and motivations of the agents but also in the organizational and cultural conditions existing within the organization. These two perspectives are closely related, since the organizational and cultural context existing within the company derives from the behavioral factors and the motivations of the agents that it comprises.

From this theoretical perspective, excessive oversight of the management team by the board of directors is unnecessary, and even counterproductive, to achieve a better corporate performance (Martin and Butler 2017). Those governance structures that emphasize executive control over board control can be more beneficial (Donaldson and Davis 1994). “Large boards, with more independent directors and non-dual leadership structures, could reduce the steward behavior of managers (Jaskiewicz and Klein 2007)” (García-Ramos and García-Olalla 2014, p. 316).

Therefore, this theory recommends smaller boards, which incorporate a high proportion of executive directors, who devote themselves more to the advisory board role than to the supervisory board role (Corbetta and Salvato 2004; Hillman and Dalziel 2003). In this same vein, dual leadership structures, that is, when the figures of the CEO and the board chairperson fall on the same person, are interpreted as a positive force leading to a better corporate performance, since it allows for a clear, well-defined business leadership (Donaldson and Davis 1991; Muth and Donaldson 1998). From this approach, a greater proportion of executive directors will result in higher business performance, since they work to maximize the wealth of shareholders; because they know the company they govern better than external directors, their decision-making process is more effective. The idea behind this approach is that thanks to the relationship of trust that they have with the company, there will be no large agency costs (Le Breton-Miller and Miller 2009; Le Breton-Miller et al. 2011). In addition, the Stewardship Theory establishes that senior executives will not harm shareholders so as not to damage their reputation (Donaldson and Davis 1994; Keay 2017). Empirical evidence about the superior capacity of executive directors to achieve a better corporate performance is inconclusive (Garner et al. 2017).

The Stewardship Theory has not explicitly indicated the processes through which the board of directors and the firm's performance are related, although the ability to carry out a more effective decision-making, which in the end positively affects corporate performance, has been considered a key aspect. Access to information, commitment, relationships of trust, and the ability to adopt a long-term vision are considered crucial for the decision-making process (Donaldson and Davis 1994; Keay 2017). In this regard, several studies have examined the greater quantity and better quality of the information held by the executive directors and their apparent relationship with long-term investment or with more balanced remuneration systems (Barontini and Bozzi 2018; Baysinger and Hoskisson 1990; Baysinger et al. 1991; Boyd 1994; Keay 2017).

The Resources and Capabilities Theory

The third of the theoretical approaches that has received the most attention in the literature on corporate governance is the Resources and Capabilities Theory (Åberg et al. 2019; Pfeffer 1972). Different studies recognize the ability of the board to access vital resources that the company needs to maximize its performance (Li et al. 2018). The definition of these resources is varied. In general, they consist of all tangible and intangible assets, human and nonhuman, that are owned or controlled by the organization and that allow it to make more efficient corporate decisions. Capabilities refer to the company's ability to deploy resources and achieve the desired end. These are tangible or intangible processes based on information that is specific to the organization and developed through time and over complex interactions between corporate resources.

This theoretical perspective postulates "that the board of directors is an essential link between the company and the resources it needs to maximize its performance" (Nicholson and Kiel 2007, p. 589) and that its members possess adequate capacities to manage those resources (Li et al. 2018; Withers et al. 2012). Although this perspective became popular in the 1970s, it was not until the 1990s that it began to receive increasing attention thanks to the emphasis of many academics on the competitive advantage that could derive from an adequate supply of resources (Barney 1991). According to this theory, directors reduce the uncertainty of the environment by providing information, which results in improvements in corporate performance (Pfeffer 1972). Authors such as Hillman et al. (2009) define the board of directors as an important potential resource for the company (Åberg et al. 2019). In reviews of the literature on governance and corporate performance, the ability of boards to provide significant resources to the company is considered one of the fundamental functions of the board of directors (Åberg et al. 2019; Korac-Kakabadse et al. 2001; Zahra and Pearce 1989).

Some of the most important resources identified in the literature are the following (Nicholson and Kiel 2007): information, capital, contacts

with suppliers, clients and other stakeholders, links with other companies, and legitimation. But undoubtedly, the attention received by knowledge (Li et al. 2018), defined by Wernerfelt (1984), stands out as an intangible resource capable of sustaining a competitive advantage in the long term and fundamental for the provision of efficient advice. Pfeffer and Salancik (1978) consider that the board of directors provides the company with four types of essential benefits: (1) advice; (2) legitimation; (3) information communication channels between the company and the environment; and (4) preferential access to resources.

Within this stream of literature, the terminology used by Hillman and Dalziel (2003) deserves special mention (Åberg et al. 2019). These authors define the capital of the board as the sum of human capital (knowledge, experience, and reputation) and social capital (network of links with other organizations and external contingencies). In this vein, it is possible to differentiate between an internal perspective, on the one hand, and an external perspective on the other. The former is geared toward the internal analysis of the company and focuses on the way in which it tries to develop its human resources with the objective of transforming them into a competitive advantage, whereas the latter is geared to the external analysis of the company and focuses on the way the firm obtains resources from the environment in which it operates.

Studies that have analyzed the board of directors under this theoretical perspective can be classified into different groups (see Barontini and Bozzi 2018; Boyd et al. 2011; Hillman et al. 2009; Li et al. 2018; Nielsen and Nielsen 2013; Terjesen et al. 2016; Withers et al. 2012). For example, there are studies that have shown that certain characteristics of a board, such as its size, independence, or gender diversity, represent a response to the external environment. There are also studies that have analyzed how changes in environmental conditions lead to changes in the structure of the board. In addition, there are the studies that have analyzed which type of companies are most likely to benefit from the provision of resources by the board. Moreover, there are

studies that have classified directors according to the type of benefits they can provide in terms of resource provision and have analyzed under what circumstances a firm could benefit more from one type of director.

Future Directions

As recently pointed out by Adams (2017), the question “what makes a board effective?” is open and continues to be an important matter in academic research and policy-making. Despite decades of research on corporate governance, there is not a theory that alone helps to configure the ideal board of directors (Aguilera et al. 2016; Andrés and Santamaría 2018; Keay 2017). More research is needed using multi-theoretical approaches in order to improve the performance of boards of directors. Nowadays, Behavioral Theory (Cyert and March 1963) is gaining importance in the field of boards of directors (Desai 2016; Kaczmarek 2017). To understand boards, “it is necessary to understand the people who sit on them” (Adams 2017). Whether characteristics of directors, such as their personality, beliefs, or values, affect the decision-making of the individuals and group members that sit on the board is the current challenge embarked upon in the most recent academic literature on boards of directors (Andrés and Santamaría 2018).

Theories on the Board of Directors

► Theoretical Paradigms of the Board of Directors

Theorizing Governance from a Banking Perspective

Adebimpe Lincoln
University of Liverpool, Law School,
Liverpool, UK

Synonyms

[Agency theory](#); [Banking sector](#); [Stakeholder identification](#); [Stakeholder theory](#)

Definition

The bone of contention in academic literature is whether to theorize governance from a shareholder-centric perspective based on the agency theoretical viewpoint or to adopt a stakeholder perspective. This is of particular importance depending on the sector or industry involved. The agency theory involves one party, the principal (shareholders) delegating work to another, the agent (directors). Many academics and researchers have theorized corporate governance in this agency perspective. For example, Shleifer and Vishny (1997) view governance as the way in which suppliers of finance to corporations assure themselves of getting a return on their investments. Fundamentally, this view proffers that the main objective of the firm is thus wealth maximization. Engaging in an operational and financial perspective of governance emphasizes the use of control or incentives and monitoring as mechanisms to align the divergent interests of shareholders and managers (Jensen and Meckling 1976). This view finds support in the earlier definition of governance offered by the Cadbury

Report (1992) where they state that governance is a system by which firms are directed and controlled. The agency theory views man as self-seeking, who cannot be always trusted to pursue altruistic goals. Thus, the theory seeks to avoid corporate executives exploiting their firms to the detriment of investors. This theory of governance is fraught with criticism. The pre-occupation of proponents of the theoretical perspective with 'shareholder primacy' and over-reliance on capital markets for performance measurement and the ultimate disciplining mechanism, ultimately encourages managerial-myopia or short-termism (Letza et al. 2004).

The stakeholder perspective on the other hand posits that governance encompasses the implementation of internal mechanisms to protect shareholder interests, as well as external mechanisms to support the relationship of firms with its shareholders and other stakeholder groups (Mallin 2019). The theory which gathered momentum in the 1970s reflected a conscious societal fear that large multinational companies had become too imperialistic and powerful to be held accountable solely through the classic stewardship hypothesis. It advocated that a good corporate governance system should establish an accountability relationship between the firm and stakeholders that could potentially be affected by the firm's activities. In light of this development, many writers and international organizations have championed the need to align governance with the stakeholder theoretical perspective. For example, the OECD (2004) recognizes that *corporate governance involves a set of relationships between a company's management, its board, its shareholders, and other stakeholders. The BCBS (2015) views corporate governance as a set of relationships between a company's management, its board, its shareholders, and other stakeholders which provide the structure through which the objectives of the company are set and the means of attaining those objectives and monitoring performance. Solomon (2010) asserts that corporate governance is the system of checks and balances, both internal and external to the company, which ensure that they are able to discharge their accountability to all stakeholders and act in a*

socially responsible way in all areas of their activities. This wider stakeholder perspective was subsequently advocated for by Cadbury in 2000. He emphasized that corporate governance frameworks should ensure that the interests of individuals, firms, and society are aligned by ensuring that the firms' resources are efficiently utilized and that accountability for the stewardship of such resources is fully discharged (Cadbury 2000).

Stakeholder identification has also become one of the central debates in stakeholder theory (Freeman 2014). It is imperative to ensure an encased category of stakeholders in order to readily identify them and balance any conflicting interests. The OECD (2004) and Freeman (2014) posit that stakeholders are individuals or groups who influence and are influenced by the firm, including shareholders, creditors, customers, employees, suppliers, owners, management and the local community, media, non-governmental organizations, and others. Stakeholders in the banking sector include customers, depositors, employees, suppliers, shareholders, regulators, auditor, the investigative media, the government, local communities, and society (BCBS 2015). A bank or banking organization is defined as an entity considered by banking supervisors to be the parent of a banking group under applicable national law as determined to be appropriate by the entity's national supervisor (BCBS 2015).

Introduction

The banking sector is pivotal to the socioeconomic development of any economy. The application of stakeholder theory in the banking sector is driven by the role of banks in the economic and financial stability of countries. The banking sector generates employment and contributes significantly to economic growth and development, thus making it more integral to a variety of stakeholders. Thus, it is imperative that banks are socially responsible. At the very least, banks should be able to build their reputational capital which enables them to attract first-class employees, charge higher fees, negotiate superior

business deals, expand customer and depositor base, attract more long-term investors, and build public trust (Lincoln et al. 2017, 2019). Stakeholder management leads to improved shareholder value (OECD 2004; BCBS 2015). There is evidence in extant literature which supports the view that banks' performance is positively associated with their orientations toward satisfying corporate stakeholder interests.

While it is accepted that the primary objective of firms is shareholder value maximization, adopting this perspective in relation to the banking sector creates a host of challenges. Firstly, in most situations, owners and managers enter into a nexus of agency contracts that specifies the powers of the manager (Jensen and Meckling 1976). Irrespective of the nexus of contracts between owners and managers, corporate defects often arise, due to the fact that it is not technologically feasible to design an all-encompassing contract or conclusively predict all circumstances that can arise from the activities pursued by management. Secondly, the cost implications associated with the design of a perfect agency contract would make it practically impossible to implement as owners often have to allocate residual control rights to management so that these agents have the authority to make decisions not foreseen by the agency contract. The implication of the transfer of such residual control rights is that management usually possesses a vast amount of discretionary powers. This, coupled with the existence of incomplete contracts, creates agency problems associated with the separation of ownership and control (Jensen and Meckling 1976). Thirdly, manager and owners are considered utility maximizers, and thus the agent cannot be trusted to always act in the best interests of the principal (Jensen and Meckling 1976) and due to time and monetary restrictions, the agent cannot be effectively monitored by the principal. This immediately creates an information asymmetry between the parties because managers, by virtue of their position, are privy to more information than the owners. This can invariably lead to moral hazard because management can have a riskier perspective of potential risk than the owners (Tricker 2012). Moreover, the agent can pursue

opportunistic behavior such as empire building at the expense of profits; engaging in fraudulent behavior, short-termism, and over-indulging in perks; but externalizing the costs to the principal (Jensen 1986). There is also the added complexity that the principal could appoint an agent who does not possess the specialized expertise necessary to fulfill the role and responsibilities of the management position. Consequently, agency theorists suggest that incentives and monitoring mechanisms are implemented so that moral hazard is prevented and the self-seeking opportunism that managers innately possess is controlled (Jensen and Meckling 1976). These incentives are financial rewards provided to management by owners for maximizing shareholder wealth. Such schemes include strategies which allow management acquire shares, perhaps at a reduced rate, so as to align the financial interests of agents with principals (Jensen and Meckling 1976).

Thus, agency theory revolves around a discourse based on the self-interested manager and shareholder wealth maximization whereas a stakeholder perspective leads to a discussion on duty and social responsibility. The 2007–2008 global financial crisis evolved from the traditional shareholder-centric notions of corporate governance to a more enlightened agency approach (Aguilera and Jackson 2010; Claessens and Yurtoglu 2012). For instance, investors are encouraged to exercise their ownership rights to prevent expropriation by management and boards; independent directors are encouraged to protect stakeholder interests; and high remuneration packages are constantly scrutinized (Claessens and Yurtoglu 2012). The most realistic compromise between these two disparate theories would be adopting the business case for stakeholder inclusion (OECD 2004; BCBS 2015). From a banking perspective, banks have to consider stakeholder interests for two reasons. First, banks have legally binding contracts with stakeholders such as creditors, customers, depositors, employees, and shareholders (BCBS 2015). Second, it is in the long-term interest of banks to recognize that fostering relationships with stakeholders is a strategic tool for enhancing shareholder wealth and ensuring bank success (BCBS 2015).

Key Issues

Historically, the perspective was that shareholders, as providers of risk capital, should be able to protect their investment by ensuring a competent board is appointed to manage the firm and also ensure that effective strategies are implemented for the firm's overall corporate performance and long-term sustainability (Mallin and Melis 2010). Undoubtedly, shareholder wealth maximization in the banking sector has introduced business models which invariably damaged stakeholder interests. This was evidenced in various banking crisis exemplified by the near-collapse or closure of several top world banks including Barings Bank, Enron, Parmalat, Northern Rock, HBOS, Royal Bank of Scotland, Citibank, Washington Mutual, Bear Stearns, Lehman Brothers, and others (Erturk et al. 2009; Mallin 2019). Consequently, there is increasing recognition at a national, regional, and international level that stakeholders who affect and are affected by the activities of the bank should have their interests protected (BCBS 2015). Consequently, the present reality is that a variegated agency and stakeholder theoretical perspective has shaped governance structures in many industrial sectors and in various countries. Agency theory fails to explain the complexity of management actions and is ill-suited to the demands of society; it is excessively rational and ignores the dynamics of modern corporate governance practices. The reality is that, a narrow focus on aligning the interests of owners and management invariably leads to an overemphasis on the control role rather than the strategy role of boards. In agency theory, good governance of non-financial firms is often defined on how effective boards are, in protecting shareholder interests. Such assumptions, however, are unsuitable for theorizing governance from a banking perspective. This is partly due to the fact that the dangers of systemic risk, coupled with the specific attributes of complexity, opacity, and heavy regulation in the banking sector, ensure that the governance problems, mechanisms, and practices have to be highly specific to the business of banking (Laeven 2012).

Within the banking sector, there is an added layer of complexity vis-à-vis regulation. Regulation is an additional external governance mechanism which alters the parameters of the principal/agent relationship in banks by introducing a third party, the regulator (Levine 2003). The aim of the regulator which is paradoxically to reduce systemic risk in banks is in direct conflict with the main objective of shareholders, which is wealth maximization. Furthermore, regulation restricts the ability of the market to discipline banks because hostile takeovers are explicitly discouraged in many countries (Laeven 2012), as they threaten the financial stability of the banking sector and other parts of the financial sector. Furthermore, the deposit insurance scheme offered by regulators, acting in its role as lender of last resort, intensifies agency problems as it increases the potential likelihood that management and shareholders will pursue excessive risk-taking ventures. Finally, Levine (2003) notes that apart from the information asymmetries between owners and managers, there are at least three additional strands of information asymmetric in the banking sector between banks, depositors, and regulators on the one hand; owners, managers, and regulators on another; and finally, borrowers, managers, and regulators. These information asymmetries are exacerbated by the opacity found in banks which ultimately creates additional problems for shareholders, regulators, and other stakeholders to monitor managerial behavior and design contracts to ensure manager objectives are aligned with stakeholder interests (Lincoln et al. 2017, 2019).

The 2007–2008 global financial crises highlighted the deficiencies in agency theory and led to a period where a more enlightened shareholder approach is pursued (Mallin 2019). This wider perspective is actively encouraged and has been adopted in the banking sector. Effective governance is critical to the proper functioning of the banking sector and the economy as a whole. Banks perform a crucial role in the economy by intermediating funds from savers and depositors to activities that support enterprise and help drive economic growth. Banks' safety and soundness are key to financial stability, and the manner in

which they conduct their business, therefore, is central to economic health (BCBS 2015). In light of the important role that the banking sector plays, the primary objective of governance here ought to be safeguarding stakeholders' interest in conformity with public interest on a sustainable basis (BCBS 2015).

Summary

There are differing theoretical perspectives seeking to provide governance frameworks to ensure that the firm is run efficiently. The agency and stakeholder theories have vied for prominence within academic debates. The agency theory which is concerned with shareholder wealth maximization fails to explain the diversity in corporate governance worldwide, and it is equally limiting and over-assuming in its suppositions. It assumes that every country has an efficient and competitive market economy, where there is dispersed ownership across a range of shareholders, and minimal information asymmetries between boards, management, and shareholders. The agency theory underestimates the implicit and explicit relationships between the firm and its various constituents including employees, creditors, suppliers, customers, local communities, and the government. Governance transcends the relationship between a firm and its investors and stretches to the various constituencies that define and are defined by the business of a firm.

The approach adopted by each firm or industry on stakeholder management, engagement, and governance should depend on the nature of its business and challenges, national corporate governance codes or principles, and stakeholder participation. Consequently, from an international and banking perspective, agency theory has a limited role to play in shaping international business environments and the banking sector specifically. The stakeholder perspective is better suited to banking. This is because the stakeholder perspective takes into consideration wider interest. The theory recognizes the need for firms to involve stakeholders who can be affected by its decisions or can influence the implementation of

its decisions and ensure that it fosters stakeholder participation in the discussion, decision-making, and implementation of solutions to common stakeholder problems and goals while also seeking to create positive relationships with stakeholders by managing their expectations and objectives. Thus, governance here focuses on the manner in which the business and affairs of a bank are governed and on how depositors are protected, shareholder obligations are met, while also taking into consideration the interest of other stakeholder groups whose interests are affected by the activities of the bank. An all-encompassing perspective in the banking sector is of utmost importance, as any governance weaknesses in banks that play a significant role in the financial system could result in the transmission of problems across the banking sector and the economy as a whole as witnessed by previous banking and financial crisis.

Theory of Simultaneous Maximums

Carmela Gulluscio
Unitelma Sapienza University of Rome, Rome,
Italy

Synonyms

Simultaneous maxima; Simultaneous maximization

Definition

Onida (1965) formulated the theory of simultaneous maximums, aimed at identifying the factors

allowing organizations to survive durable over time and to operate in optimal management conditions. This theory has strong links with the concept of ► “*economicità*” and ► “*durable survival of the organization*”. Unlike the concept of “*economicità*,” which identifies the minimum conditions allowing companies to survive over time, the theory of simultaneous maximums seeks optimal management conditions under which the company can not only survive, but also thrive.

According to this theory, profit-oriented firms can achieve their lasting survival over time, not in function of the profit maximization, but pursuing together four maximums, which must be dynamically combined, namely: maximizing shares of profits, self-financing, salaries/wages, and setting appropriate sales prices able to stimulate the consumer demand.

Introduction

During the last decades, sustainability and social responsibility (CSR) have become increasingly relevant aspects for corporations. Even if these topics have become popular in management and business administration practice and academic literature in relatively recent times, both practitioners and academics started to pay attention to these aspects some decades ago. A growing attention toward CSR issues started from the early 1950s (Carroll 2008), while the attention toward sustainability issues mainly increased from the publication of the Brundtland Report (WCED 1987), focusing on the concept of “sustainable development.”

The theory of simultaneous maximums is an example of a pioneering approach to these issues within a national academic setting. It was formulated in the 1960s by Pietro Onida (1965), an Italian Business Administration scholar who devoted deep attention to the dual role of profit-oriented companies, considered at the same time as instruments of production and distribution of wealth.

This theory was innovative at the time of its formulation since it started from the assumption

that profit maximization, hitherto considered the main objective of for-profit organizations, is not the main objective that such organizations have to pursue to ensure their durable survival and to satisfy the needs of corporate stakeholders. According to Onida, for-profit organizations must not tend to maximize profit but must aim to maximize other conditions taking into account the interests of the main corporate stakeholders that he identified in the shareholders, employees, and customers.

In recent decades, the concept of “stakeholder” is evolving, with an increase in the type and number of subjects deemed to be relevant stakeholders to whom report the results of the company’s activity. This change is conditioned by the growing attention to the sustainable development goals (SDGs), i.e., the United Nation’s principles aimed at ending poverty, protecting planet earth, and ensuring that by 2030 people can enjoy peace and prosperity. This broadened viewpoint is coherent with Freeman (1984), who argues that organizations are responsible to the whole society, and therefore everyone can be considered as a stakeholder.

Consistently with these changes in the way corporate stakeholders are interpreted, the theory of simultaneous maximums should be reexamined and broadened.

Historical Roots of the Theory of Simultaneous Maximums

Within the Italian business administration and management academic literature, the attention toward social and sustainability issues initially focused on profit-oriented companies (both on big corporations and smaller firms), which were meant as entities that had to operate for the pursuit not only of profit but also of social goals. In this approach, the social distribution of wealth occurs through the following policies: dividends (i.e., shares of profits), self-financing, wages and prices. In Onida’s opinion, the firm’s lasting survival does not require profit maximization, especially in the short term; it requires the achievement of four simultaneous maximums related to the abovementioned policies.

Capital investments in a certain firm are attracted not so much by high profits, but rather by prospects for lasting profits over time and lasting development of the firm. The conditions for achieving sustainable development of the firm are much more complex than the simple maximization of profit: they require to maximize jointly the expectations not only of the shareholders but also of other subjects contributing to the firm’s survival, i.e., workers and customers. In other words, the lasting survival and prosperity of the company presupposes the achievement of simultaneous maximums of wages, dividends and self-financing, dynamically combined, and accompanied by prices suitable to sustain and expand the demand for the firm’s products and services. In the author’s opinion, in the long term, this is the most valid economic policy for the firm, as it reconciles opposite interests, which thus converge towards the common good.

According to Onida, the firm’s economic results should be analyzed from two main points of view: (a) profitability; (b) productivity.

Profitability (a) relates to equity and is expressed by the net profits.

Productivity (b) can be understood in two ways:

- (i) With reference to specific production factors or processes, showing the more or less high returns that the firm can obtain from these factors or processes.
- (ii) In reference to the entire firm, looking at its ability to adequately remunerate the capital and the human labor employed in the company and to sell products and services at prices that stimulate consumption, competitiveness, and the firm’s development.

While profitability (a) could theoretically be maintained in the short term at the expense of the firm’s workers and consumers, favoring exclusively the achievement of high profits, productivity (b) cannot be limited to giving a fair return on equity. In fact, according to Onida, the prosperity of firms lasts for a long time and develops by spreading it among others, rather than defending

it from others. The prosperity of individuals, firms, and nations cannot last long if it is built on the misery of others. In this sense, the conditions necessary to achieve the survival and development of the individual firms converge with the demands of superior social ethics.

The above considerations lead to the conclusion that the spirit of sociality that should guide the firms' behavior in their relations with shareholders, workers, and consumers does not conflict with the firms' ability to survive durably; on the contrary, it allows to achieve the firm's survival in the medium to long term. The managerial choices based on socially responsible criteria are therefore consistent not only with morality but also with economic and managerial principles. In this sense, a sustainable management policy requires to conjointly maximize profits, wages, and self-financing, and to fix prices able to expand the demand of the firm's products and services. Only a dynamic equilibrium among these four maximums allows firms to operate in the medium and long term according to sustainable management policies.

The formulation of the theory of simultaneous maximums can be traced back to the spread of the institutionalist approach in the Italian business administration and management disciplines (Rappa 2005, p. 449). This approach recognized to profit-oriented companies an institutional subjectivity, beyond the subjects belonging to the ownership and the corporate governance structure. It also assumed an institutional responsibility of companies to be accountable to an increasingly wider public for the activities carried out.

In this context, a series of reflections on the environmental relationships of companies have developed within the Italian business administration and management literature, including reflections on the redefinition of the role of financial statements and the income.

Even before Onida, another Italian scholar (Palumbo 1934) was oriented in this direction. According to him, the maximum profit for the entrepreneur should be replaced by the maximum usefulness for all the members of the company.

Similar reflections can be found in Panciera (1939), who proposed the creation of two separate statements:

- (a) An income statement;
- (b) A social functionality report.

The first statement would have been aimed at expressing the profit or loss of the year to satisfy the cognitive needs of all the subjects involved in its production (i.e., state, shareholders, entrepreneur, and workers). The second statement was supposed to express in statistical terms a series of information relating to the role of the company in the corporate economy.

Key Issues

According to Onida, the firm should be considered as a community. Within this community, human work and capital are essential and equally important productive factors that must interact since the long-lasting existence and prosperity of the firm requires the conjoint achievement of maximums for wages, dividends, and self-financing, as well as an appropriate price policy, for the purpose of their mutual reinforcement.

Firms are therefore considered as economic and social institutions aimed at lasting overtime in which apparently opposing interests (coming from owners, workers, and consumers) find a balance, thus converging towards the common good.

From the One Bottom Line to the Triple Bottom Line and to Sustainability

Onida's theory of simultaneous maximums can be considered as an early example of a corporate social responsible interpretation of the firm's role within Italian accounting, business administration, and management literature. At the time of its formulation, Italian accounting scholars considered financial statements essentially as: (a) an internal information tool for company managers; (b) an external information tool for a small group

of stakeholders, essentially limited to the current and potential financiers, the customers and the subjects appointed to control the financial statements.

At Onida's time, a current of thought advocating information tools other than the traditional financial statements had not yet been consolidated. Therefore, Onida can be considered as a forerunner to the currents of thought leading to the introduction of the social balance in Italy in the 1980s.

Onida's simultaneous maximums focus on the following elements: (a) dividends, (b) self-financing, (c) wages, and (d) prices. Among them, dividends (a) and self-financing (b) can be considered as elements relevant especially for the firm's owners, wages (c) are most relevant for workers, while prices (d) are most relevant for customers. Onida's theory seems therefore to broaden the ancient and classical "one bottom line" approach (i.e., the focus of accounting only on financial aspects) to a "two bottom line" approach (i.e., a focus on both social and financial aspects). Only in the following years (almost starting in the 1980s), the Italian accounting and business administration scholars started focusing deep attention on the triple bottom line approach (i.e., an accounting framework focusing on financial, social and environmental/ecological aspects).

Onida's theory can, therefore, be considered not only as a forerunner of the triple bottom line accounting approach but also of sustainability accounting and accountability. The latter is connected with the Sustainable Development Goals (SDGs), i.e., a blueprint to achieve a better and more sustainable future for all.

Knowing the historical roots of social responsibility, sustainability, and sustainable development literature can be useful to better understand the conditions leading to the current state of social and sustainability accounting and accountability tools. In this sense, Onida's simultaneous maximums theory is a relevant piece of history explaining the current status of social and sustainability accounting, reporting and management practices in a local context.

Future Directions

Onida's theory of simultaneous maximums has oriented the firm's vision in the direction of the "two bottom lines" approach. Current developments in business theory imply going beyond the more advanced triple bottom line approach, moving to the logic of sustainability and sustainable development. Taking a cue from Aras and Crowther's (2009) model of sustainable development, the dimensions necessary to achieve sustainable development are four, namely:

- Finance: According to the authors, it implies maintaining economic equilibrium. More precisely, this dimension includes also financial, monetary, and owners' equity equilibria (► "Economicità").
- Societal influence: It implies ensuring social justice and is achieved through actions aimed at reducing poverty, protect human rights, guarantee universal access to education, promote peace, etc.
- Environmental impact: It entails environment protection aimed at maintaining the availability of production factors for future generations.
- Organizational culture: It requires the development of spiritual and cultural values to align societal and corporate values in the individual.

The theory of simultaneous maximums touched the first two dimensions of this model. References to the last two dimensions, i.e., environmental impact and organizational culture, are missing. A contemporary reinterpretation of this theory implies pursuing the following simultaneous objectives:

- 1) Maintaining economic, financial, monetary, and owners' equity equilibria.
- 2) Achieve good organizational performances in terms of effectiveness and efficiency.
- 3) Maximizing shares of profits, self-financing, and salaries/wages.
- 4) Setting appropriate sales prices able to stimulate the consumer demand.

- 5) Minimizing the environmental impact of the organization's activity.
- 6) Maximizing the alignment of societal and corporate spiritual and cultural values.

These objectives are the conditions that can allow organizations to lasting survival over time.

Summary

After a definition of the theory of simultaneous maximums, the entry provides an introduction aimed at describing the social and historical context in which this theory was formulated. Thereafter, the entry focuses on the historical roots of this theory within the Italian business administration and management academic literature. It focuses on the need to conjointly achieve the maximum of wages, dividends, and self-financing, as well as an appropriate price policy, for their mutual reinforcement.

Thereafter, the entry focuses on the evolution from the one bottom line to the triple bottom line and sustainability. Considerations about the future directions of this theory in an international business theory context close the entry.

Boiling point; Critical point; Shift point; Threshold; Turning point; Trigger event

Definition

The term that has gained great popularity in many disciplines such as climatology, sociology, physics over the last decade, has held various conceptualizations and also has been put to many different uses across such a wide range of disciplines (Milkoreit et al., 2018). Especially after the 2000s, the term was mostly recognized to describe sudden changes by climate scientists (Kopp et al., 2016). However the usage of the phrase, the concept was popularized by Malcolm Gladwell. The term of tipping point attributed to him - in his book entitled “Tipping Point” (2000) – is considered as “the moment of critical mass, the threshold, the boiling point”. In today’s modern business world, diverse tipping points in terms of sustainability are also identified and heavily discussed since a dramatic increase in the human imprint seems to push the planet toward a tipping point that could bring about an abrupt change (Grainger, 2017; Morello, 2012).

A Brief Explanation

The tipping point occurs when a threshold is crossed (Gladwell, 2000) and it explains how a level (Walsh, 2007), trend, process, moment, message, or idea “spread like wildfire” (Gladwell, 2000). It is defined as the time or the point at which the momentum for a change or an effect becomes unstoppable (Cambridge English Dictionary, 2021; Ivkovich, 2017). The idea of tipping points is related to the transition of an unstable situation to a new state where it is repositioned (O’Riordan, 2013). According to Gladwell (2000), “the tipping point is the moment of critical mass, the threshold, the boiling point” and also “the world of the tipping point is a place where the unexpected becomes expected, where radical change is more than possibility”. Therefore, it also reflects an era of unimaginably dangerous and politically turbulent events normalized, and of intense concerns about the fear of losing control (O’Riordan, 2013). This characterization, in a sense, also seems to refer to the extraordinary Covid-19 global epidemic period we are still in (see Daniel, 2020 and Karine, 2020).

Its Relationship with Covid-19

As a matter of fact, recent studies have been intensely discussing the Covid-19 crisis period as a tipping point especially for sustainability (e.g., Ford, 2020; The World Bank, 2020; Trinquetel, 2020). Undoubtedly, Covid-19 has had a huge impact on social (people), environmental (planet), and economic (profit) activities, creating a simultaneous and sudden change in the way systems operate as usual, all over the world. According to the results of the survey conducted by McKinsey and Company (2020a, b), companies responded 20 to 25 times faster than expected to several Covid-19 related changes, especially in remote working. Such rapid shifts are seen as a result of passing a tipping point (Heinze et al., 2021). In this respect, crossing a threshold requires a radical transformation since existing systems are no longer valid since they have not enough capacity to respond to this huge

transformation, totally a new perspective is needed. Similarly, Werners et al.'s (2013) study, which examines sustainability in terms of thresholds, tipping, and turning points within the scope of climate change, emphasizes that once the critical threshold is exceeded, current management strategies will no longer meet the objectives. Moreover, this will require long-term planning accompanied by uncertainty and also a deep understanding of the system, including discussion of thresholds that society should not violate (Werners et al., 2013).

Discussions about Reaching a Tipping Point

On the other hand, there have been some discussions about reaching a tipping point despite inconsistencies. It is noteworthy that there is a lively discussion area regarding tipping points specific to various issues such as energy (Khokhar & Banerjee, 2017), water (Ahmada, 2015), education and technology (Trucano, 2014), or climate change (Pereira & Viola, 2020; Werners et al., 2013) within the scope of sustainability. However, due to the populist focus of today's modern business world on short-term economic profit, unfortunately, sustainable globalization seems far from reaching a tipping point (Fernando, 2012). Moreover, unless this short-term obsession with "Doing good to look good" is abandoned, it will be impossible to embed sustainability into corporate and national strategies, and a tipping point for sustainability will remain just a concept (Fernando, 2012). Therefore, a global holistic approach toward sustainability is needed (Fernando, 2012). Contrary to this, according to the results of the survey conducted by the MIT Sloan Management Review and Boston Consulting Group, in which approximately 3000 executives and managers of commercial companies around the world participated, it seems that sustainability is approaching the tipping point, 70% of companies are putting sustainability on their management agenda (Kiron et al., 2012). Moreover, they are not only implementing sustainable practices in various subjects such as carbon

emission, energy, consumption, etc. but also changing their operational structures and strategies. (Kiron et al., 2012). In a similar vein, Pearce and Stahl's (2015) study, also emphasizes that we are on the edge of such a tipping point for sustainability and corporate social responsibility. In terms of such studies, the world seems to stand near a shift point.

Tipping Points for Sustainability

Furthermore, some studies also provide a kind of roadmap that enlightens some priorities for a sustainable future. For instance, McKinsey and Company (2021), especially for climate change, specifies five action areas that will ensure sustainability to flow in the right direction while at the tipping point: (1) Energy Transitions (2) Mobility (3) Circular Economy (4) Sustainable Investing and (5) Sustainable Agriculture. Firstly, taking action on *energy transitions* states the necessity of returning to renewable and efficient energy production or sources such as solar and wind. According to the report, although emissions related to energy are expected to decrease by 20% by 2050 due to a possible decrease in coal use in the electricity sector after peaking in 2024, in this case, however, it will still be far from the 2-degree path of (McKinsey & Company, 2021; Pinner, 2019), the Paris Climate Agreement which "aims to limit global temperature rises to 2°C and preferably keeping the increase to 1.5°C" (McKinsey & Company, 2020b). On the other hand, the second action area points to "the lack of *mobility* options beyond carbon-intensive road transport and limited community planning capacity (OECD iLibrary, 2021)". Despite energy-efficient and environmentally friendly innovations in transportations, there is a huge global challenge for achieving sustainable mobility (McKinsey & Company, 2021; OECD iLibrary, 2021). Since how we experience mobility directly depends on where we live (McKinsey & Company, 2021), in a sense, this also reveals a vivid touch on human rights that will enable all humanity to experience this mobility in safe, fast, fair, and equal conditions. Because the presence of

such a context-dependency also calls for the right to life “globally in an equal manner, on the same footing and with the same emphasis (United Nations, 1993)”. As for *circular economy*, it necessitates disrupting the fast/over-production and consumption trends of today’s society (Aras-Beger et al., 2020). As stated by the report, the value of the waste material that is thrown around the world corresponds to \$2.6 billion each year (McKinsey & Company, 2021). It is quite clear that the planet no longer approves today’s production and consumption patterns, and existing systems are no longer adequate to handle such a load. As stated in the McKinsey and Company (2021) report, without urgent action, the waste amount would rise to 460 billion by 2030 while also in the World Bank report, by 2050 global waste is expected to have increased by 70% (Kaza et al., 2018). Finally, the fourth action area, *sustainable investment*, points to creating a space that enable investors to make decisions and valuable investments that take into account corporate social responsibility and sustainability issues, while *sustainable agriculture* as the fifth emphasizes the vital need for breaking the unsustainable loop of food systems that cause 20–30% of greenhouse gases and 70% freshwater withdrawals (McKinsey & Company, 2021; Pinner, 2019). However, initiating a transition under such an action plan focusing on five themes would require a solid infrastructure for each step of that plan (Pinner, 2019).

Towards a More Sustainable Future

Gladwell (2000) also suggests three rules of the tipping point to make a sustainable change happen: (1) *the Law of the Few* (the messenger), which states a small group of people (e.g., Connectors, Mavens, Salesmen) who have capability to spread messages to wide audience quickly, (2) *the Stickiness Factor* (the message itself), which means that these messages, in a sense, stick in memory and make an impact (e.g., Sesame Street) (3) *the Power of Context* (the context of the message), which reflects the constant interaction of human beings with their immediate

environment within the scope of their perception, attitudes, and behaviors (e.g., Zimbardo’s Stanford Prison Experiment or Gladwell’s example: reducing the crime rate in New York City’s subways in the mid-nineties simply by removing graffiti and signs of vandalism from stations) (Doscher, 2013; Gladwell, 2000).

Summary

The aforementioned discussion highlights that the term tipping point is quite popular and commonly used. Although its usage has some nuances semantically, it seems to have achieved semantic consistency in general. However, it is still unclear whether we are in a place that is about to reach a tipping point that has accumulated a critical mass or are we in an early stage of a radical change that has already passed the point.

Tobin Tax

Alexandra Korcheva

Sofia university “St. Kliment Ohridski”, Sofia,
Bulgaria

Synonyms

Financial transactions tax; FTT; Robin Hood tax

Definition

The Tobin tax is a form on taxation that proposes taxing currency exchange. Nobel Laureate James Tobin proposed the tax in 1974 and it was considered a measure against currency speculation (Raffer 1998).

Tobin suggested taxing currency transactions in order to prevent short-term currency speculation. He proposed this measure in light of the Bretton Woods’ system termination (Tobin 1978). As the USA had abandoned convertibility to gold of the dollar, states became exposed to exchange rate volatility risks. In order to ensure overall economic stability nations needed to introduce measures that would overcome threats of economic turmoil due to overspeculation with currency exchange.

The idea of Tobin was to slow down exchange rate volatility (Tobin 1996). For that reason the size of the Tobin tax was considered crucial. It had to be set on a rate that would make it unattractive for short-term purely speculative currency exchange but not so high as to impact negatively investment and trade.

As former Breton Woods members moved to a regime of floating exchange rates, the proposal for a Tobin tax on international currency exchange never caught on. Voices that consider the introduction of a Tobin tax necessary were raised periodically (Raffer 1998). In the early 2000s antiglobalization movements advocated for the introduction of a Tobin tax (Buckman 2004, p. 126).

After the 2008 financial crisis some governments have come back to the idea for financial

transactions tax (Yates 2009) but widespread implementation of the Tobin tax did not develop.

History of the Tobin Tax

In the context of a globalizing financial market, rising global interconnectedness, and no world exchange rate in the post-Breton-Woods financial system, the room for speculation and potential overheating was announced as a major field of potential negative effects on economies. In this line of thought James Tobin recognized flexible or adjustable currency exchange rates plus free movement of funds across currencies as a hazardous compound to economic health of nations (Tobin 1996). In the context of that notion, he proposed a measure to “throw some sand in the wheels of super-efficient financial vehicles” (Tobin 1996, p. 65) by introducing a financial transactions tax (FTT). The FTT later became known also as the Tobin tax.

Tobin proposed his currency transactions tax during a lecture in honor of Joseph Schumpeter at Princeton in 1972 as a measure to enhance the efficacy of macroeconomic policy (Raffer 1998). A few years later, he drew attention to the revenue potential of the proposed tax, which he saw as a by-product. Thus, both reasons for a Tobin tax quoted by its advocates at present were on the table in the 1970s (Raffer 1998).

Box 1

James Tobin (1918–2002), after whom the Tobin tax was named, was an American economist who became a recipient of the Nobel Memorial Prize in Economics in 1981. He is known for his contributions “for his analysis of financial markets and their relations to expenditure decisions, employment, production and prices” (The Royal Swedish Academy of Sciences 2019).

Despite it initially gained interest among researchers and some representatives of national governments (World Parliamentarians Call for

Tobin Tax 2020), the Tobin tax never became a widely used instrument for regulation of financial transactions.

The 2008 financial crisis was a period when the idea of FTT had a rise once again (Yates 2009). As countries strived to manage the consequences of the crisis, sentiments towards reformation and systemic improvement of the financial system rose debate. The discussions about the Tobin and Spahn taxes reappeared in both academia and politics, viewing them as possible tools for achieving system control and lower financial volatility (Yates 2009).

Some propositions for redistribution of Tobin tax income towards sustainable development goals have been taken into account (Yates 2009).

Pros and Cons of the Tobin Tax

Despite that governments have not had a huge interest in the Tobin tax as a policy tool, the international economic research community did elaborate on the proposition of FTT in a number of recurring in time.

Researchers have outlined the two major potential uses of a Tobin tax. On one hand, the Tobin tax is viewed as an instrument for facilitation of macroeconomic stability (Felix and Sau 1996; Tobin 1996). On the other hand, the revenues from the Tobin tax have been proposed to be redistributed across various fields of economic and social life. Felix and Sau suggest that the revenues from a low Tobin tax could be invested in funding international institutions and sustainable development (Felix and Sau 1996).

Eichengreen and Wyplosz argue that taxes on international financial transactions could enhance the operation of the international monetary system and the successful application of restrictions on capital imports is inconsistent with more extreme arguments about the potential ineffectiveness of such measures (Eichengreen and Wyplosz 1996).

Opposers of the Tobin tax often could stem from the idea of a free market exchange as efficient. Dooley argues that the Tobin tax is designed to discourage short holding periods and for that reason it would have no predictable effect on the

composition of capital flows (Dooley 1996). In his argument Dooley defines the weakest link of the Tobin tax idea as the assumption that a tax on transactions “will fall differentially on speculators who base their positions on price dynamics as compared to speculators who base their positions on fundamentals” (Dooley 1996, p. 84).

One of the most prominent critiques of the Tobin tax was that of economist Paul Spahn, who introduced an alternative to the Tobin tax, which came to be known as the Spahn tax. Paul Spahn argues that the Tobin tax is not viable and that it is not only an unlikely instrument to deter speculation but it would also impair financial operations and create international liquidity problems (Spahn 1995). It is also unlikely to deter speculation. He proposed an alternative tax, inspired by the European Monetary System, which would consist of a two-tier rate structure with a low-rate transaction tax plus an exchange surcharge (Spahn 1995).

Introduction

Total Quality Management (TQM) is a systematic management approach that contributes to the optimization of the quality of a company's products, services, and processes in all functional areas and at all hierarchy levels through the participation of all employees. In this respect, it differs from quality management, which is narrower and refers only to the planning, control, and monitoring of the quality of a process or process result. According to ISO 8402:1994, TQM is "a management approach of an organization centred on quality, based on the participation of all its members and aiming at long term success through customer satisfaction and benefits to all members of the organisation and society" (ISO 8402:1994).

History and Definition of Total Quality Management

According to Powell (1995), the origins of TQM can be traced back to 1949, when a committee of Japanese scholars, engineers, and government officials aimed to improve Japanese productivity with the overall goal of enhancing quality of life. Companies of the USA first took note of TQM around 1980 (Powell 1995). Although it is unclear, when the term TQM exactly came up, the philosophy and the concept as a whole were introduced in the mid-1980s (Martínez-Lorente et al. 1998, p. 4). The term might be a substitute of "Total Quality Control (TQC)" (Feigenbaum 1961), which was previously in use. With the idea that quality cannot be controlled but has to be managed, it might have turned into TQM (Martínez-Lorente et al. 1998, p. 4). Dale states that the term derived from the "Department of Trade and Industry" in the UK during its "National Quality Campaign" in 1983 (Dale et al. 1994). In contrast, Bemowski (1992) believes that the term first came up in 1985 in the US Naval Air Systems Command, in order to describe the Japanese approach toward quality improvement (for TQM in Navy organizations see also Housten and Dockstader 1988, 1997).

However, the confrontation with the philosophy of TQM coincides on the one hand with the penetration of the US market with Japanese products and on the other hand with the publications of Crosby (1979, 1987, 1992), Deming (1982, 1986), Feigenbaum (1956, 1961, 1991), Juran (1988, 1995), and Juran et al. (1974; Juran and Gryna 1988) as well as Ishikawa (1985, 1989, 1990) (Martínez-Lorente et al. 1998, p. 4).

There is no broad agreement on what TQM is and what action it requires from organizations. Several definitions exist. The abovementioned TQM gurus had a partially different understanding of TQM and took a different approach toward it. Nevertheless, according to Neyestani 2017, some shared aspects can be identified:

1. Management commitment;
2. The strategy, policy, and firm-wide control;
3. Employee education and training;
4. Employee's award;
5. Improvement of process, quality system, and product design;
6. Designing system based on prevention;
7. Focusing on quality improvement instead of the inspection;
8. Customer orientation and;
9. Quality is first and schedules are secondary. (Neyestani 2017, p. 15)

The inherent concept of TQM is continuous improvement of business quality performance. It is based on establishing proper systems in order to be able to lead an organization effectively and to meet customer requirements (Neyestani 2017, p. 15).

According to Martínez-Lorente, Dewhurst, and Dale (1998), the application of TQM differs from country to country, because of different cultural characteristics leading to a culture-specific understanding of quality in general and of TQM in particular. Only recently, as a result of globalization and the interdependences of markets, differences are diminishing (Martínez-Lorente et al. 1998, p. 13).

Against this background, also different TQM-based quality awards have been created in Japan, the USA, and finally in Europe in order to promote and recognize efforts to achieve quality in

the encompassing understanding that underlies the TQM approach. The three most famous awards are the Malcolm Baldrige National Quality Award in the USA (2019), the Deming Application Prize (2019) in Japan, and the EFQM Excellence Award (2019) in Europe. Even though the awards are consistent in essential points, there are differences resulting mainly from the use of different criteria for the operationalization of the respective quality concept. The most widespread TQM approach in Europe is the European Excellence model of the European Foundation of Quality (EFQM), which, thus, will be briefly presented below.

As an European specific theoretical foundation the holistic management approach of the St. Gallen School of Management was used (Rüegg-Sturm 2003). Unlike the Japanese and US-American versions of TQM, the EFQM model from the very beginning was values-based, took into account one of the most important informal governance mechanisms in the form of corporate culture, and integrated the need of a multi-stakeholder perspective into the description of its quality criteria (Kleinfeld and Rottluff 2016).

European Foundation of Quality Management

The European Foundation for Quality Management (EFQM) is a nonprofit membership organization, which was founded in 1988 by 14 boards of leading European companies, namely, AB Electrolux, British Telecommunications plc, Bull, Ciba-Geigy AG, C. Olivetti & C. SpA, Dassault Aviation, Fiat Auto SpA, KLM, Nestlé, Philips, Renault, Robert Bosch, Sulzer AG, and Volkswagen. The aim of the initiative was to ensure Europe's long-term competitiveness (EFQM 2019). In comparison with the developments of management theory in the USA and Japan in the 1980s, European management was perceived as backward and uncompetitive. As a result, the potential of European companies was pooled, and the EFQM model for business excellence was developed.

EFQM as an organization concentrates on four areas:

1. Due to membership and its community, EFQM offers an environment in which individuals and organizations can share, learn, and collaborate.
2. Via offering training, self-assessments, and assess base/learning and sharing, EFQM offers its members a holistic view on the entire enterprise in order to progress toward sustainable results and an adaptive culture.
3. With the help of the EFQM recognition, organizations can demonstrate how well their organization is performing against the success criteria of the EFQM excellence model. Role model organizations, which have a track record of success in turning strategy into action and improving their performance continuously, are recognized by the EFQM Global Excellence Award (preliminary stages for these awards are the “Swiss Award for Excellence” in Switzerland and the “Ludwig-Erhard-Preis” in Germany; ILEP 2019).
4. By offering a library, a list of frequently asked questions, and an image gallery, EFQM keeps their members informed so that they can improve continuously.

Because of being a not-for-profit membership foundation, EFQM is run by its members. Its headquarter is located in Brussels. A board of directors, which meets twice a year, oversees EFQM’s operations. It ensures that the mission is always present, that interests of stakeholders are taken into account, that the added value of its members is maximized, and that EFQM remains financially independent. The board of directors is supported by a strategy committee, a finance and audit committee, and a nomination and HR committee. EFQM currently has 13 permanent employees under the leadership of CEO Russell Longmuir.

EFQM Model for Business Excellence

A group of experts from different sectors and academic institutions created the first version of

the EFQM excellence model in 1992 – at this stage primarily as a framework for assessing applications for the first European Quality Award, the European version of the US Baldrige Award, and the Japanese Deming Application Prize (see above).

Representing a Total Quality Management (TQM) approach, the model aims to improve both the process and the relevant value-added quality of an organization. Unlike ISO 9001, the EFQM model from its very beginning claimed to be a value-oriented concept designed for the application to any organization, regardless of industry, culture, or size. The “European Convention on Human Rights” of 1953 and the “European Social Charter” in their 1996 edition constitute the foundation of values of the model (see EFQM 2012, p. 2). In addition, the EFQM model is guided by the principles of the United Nations Global Compact (UNGC) and calls on all organizations striving for excellence to join United Nations Global Compact (EFQM 2012) and to respect and act upon the essence of the Sustainable Development Goals (EFQM 2019).

The model that is regularly revised consists of three major components:

- (I) The eight fundamental concepts of excellence:
 1. Adding value for customers
 2. Creating a sustainable future
 3. Developing organizational capability
 4. Harnessing creativity and innovation
 5. Leading with vision, inspiration, and integrity
 6. Managing with agility
 7. Succeeding through the talent of people
 8. Sustaining outstanding results

- (II) The nine evaluation criteria:

The first five criteria are the prerequisite for successful management, being called “enablers”:

- (a) Leadership
- (b) People
- (c) Strategy
- (d) Partnerships
- (e) Resources
- (f) Processes, products, and services

The last four criteria represent the multi-dimensional output of an organization and are called “results”:

- (a) People results
 - (b) Customer results
 - (c) Society results
 - (d) Business results (EFQM 2013, p. 10)
- (III) The RADAR logic. It is the basis of the “striving for excellence approach” of the EFQM model in the form of a dynamic assessment tool, which ensures continuous improvement by questioning an organization’s performance. The RADAR logic is not only verifying the existence of certain requirements but is evaluating the quality of their implementation/realization at the same time. Therefore, it demonstrates that an organization:
- (a) Determines the results it is aiming to achieve as part of its strategy
 - (b) Plans and develops an integrated set of different approaches in order to deliver the required results (nowadays and in future)
 - (c) Deploys the approaches in a systematic way in order to ensure implementation
 - (d) Assesses and refines the deployed approaches (via monitoring and analysis of the results achieved and ongoing learning activities)

The last version of the EFQM model (described above and called “EFQM 2013”) is free for download at the EFQM website.

On the annual forum in Helsinki on 23rd and 24th of October 2019, the new EFQM model (named EFQM 2019) was released. According to ILEP 2019, the new version focuses much more on the further development of the organization. It has an even stronger character of a management approach than of a valuation model. Corporate culture has become a separate perspective in the new version, thus underlining its importance for corporate success in the twenty-first century. Besides, leadership is now considered as an integral part at all levels within the model. This shall help to understand the conceptual work as well as the day-to-day business of the executives across

all levels. A particular strength of the new model lies in the consideration of the need to transform organizations in contrast to the classic improvement and performance orientation in the sense of a performance management model. The pro-competitive features are the flexibility and adaptability of companies. Looking into the future and anticipating new trends are seen as one of the most important critical success factors for the development of organizations (ILEP 2019).

Against this background, the new model focuses on three essential questions, which comprise seven criteria:

- (I) “Why” does the organization exist? What purpose does it fulfill? Why this particular strategy? (direction)
 - 1. Purpose, vision, and strategy
 - 2. Organizational culture and leadership
- (II) “How” does it intend to deliver on its purpose and its strategy? (execution)
 - 3. Engaging stakeholders
 - 4. Creating sustainable value
 - 5. Driving performance and transformation
- (III) “What” has it actually achieved to date? “What” does it intend to achieve tomorrow? (results)
 - 6. Stakeholder perceptions
 - 7. Strategic and operational performance.
 (Moll and Zeller 2019)

The basic principle (“red thread”) of the EFQM model is the combination of an organization’s purpose, vision, and strategy and how it creates sustainable benefits and delivers outstanding results for important stakeholders (EFQM 2019). With these objectives, the EFQM model is an effective instrument for running an organization in a sustainable manner.

Major Accomplishments

According to EFQM, the model helps to define an organization’s purpose. It supports the conscious development process of organizational culture, forms strong managers, eases transformation, fosters agile practices, addresses unique

organizational challenges and finally, helps to forecast future, and is therefore essential to companies that aim to strive for sustainable excellence (EFQM 2019).

Hendricks and Singha, 1996, who investigated the correlation between the adoption of holistic models such as the EFQM excellence model and improved results of the organization, summarize:

We note that the abnormal returns generated by the quality award winning announcements provide a lower bound for the impact of implementing an effective quality award improvement program. Our results show that the stock market reacts positively to quality award announcements. (Hendricks and Singha 1996, p. 415)

Over the course of its development, the EFQM model has evolved into a holistic management model aiming for sustainable development, both of the organization itself and of the global society.

It combines the requirements of the “Triple Bottom Line” and takes into account the interests of different stakeholders. This becomes particularly evident in the requirements of the EFQM model 2013: “Excellent Organizations achieve and sustain outstanding levels of performance that meet or exceed the expectations of all their stakeholders” (EFQM 2012, p. 2).

This orientation is also reflected in EFQM’s vision: “A world striving for sustainable excellence” (EFQM 2013, p. 4). According to EFQM Corporate Social Responsibility is an essential ingredient for the survival of any organization (Schaltegger and Müller 2008, p. 17 according to EFQM 2004, p. 6). That “creating a sustainable future” is one of the eight fundamental principles of business excellence of EFQM, which underlines this statement.

The EFQM model shows a strong stakeholder orientation, which gives this instrument weight in the context of the CSR debate. In contrast to other instruments, the EFQM model takes into account negative externalities of an organization and tries to counteract them on the basis of the catalogue of criteria (see Lorentsichs and Walker 2012, p. 304). It provides a framework for reducing and managing complexity and provides users with assistance in controlling, evaluating, and developing their own organizational performance.

It, thus, may be considered as one of the most appropriate management frameworks for integrating social responsibility and sustainability management into the corporate governance of organizations (Kleinfeld and Rottluff 2016).

According to EFQM, more than 30,000 organizations worldwide have been using the EFQM model so far (see EFQM 2013, p. 2).

Criticism

Although, according to Zink, the fathers of the EFQM model were more motivated by “cost reduction by process optimization” (Zink 1998, p. 219) than by a contribution to the sustainable development of society, a continuous development toward a holistic management approach including sustainability and responsibility can be observed.

Zink already noted in the late 1990s:

“Although it is necessary and makes sense to reduce internal planning and overheads, these are not the right concepts to secure the future of businesses” [...]. “Optimal processes alone will not, however, secure long-term survival, even with customer orientation” (Zink 1998, p. 219). Despite the abovementioned positive development of the EFQM model, it must be pointed out that in practice it is often not implemented for sustainability reasons but rather for the purpose of efficient process optimization with the aim of utilitarian profit maximization.

In addition, the EFQM model has been criticized for having included a large amount of soft factors in its pool of criteria, thus being inappropriate for measuring business success. This is considered especially critical since the instrument would therefore not meet its own functional requirements (Gucanin 2003). The positive effect of the model on business success would remain questionable because it cannot be measured sufficiently precisely. According to Gućanin, this is mainly due to the fact that the sub-criteria of the EFQM model do not provide a sound basis in terms of content (see *ibid.*). It should also be noted that a solid corporate culture does not develop through mere setting and codification, i.e., by the formulation of mission, vision, and

values, but must actually be lived and communicated in a credible way. It seems that the latest version of the model, shortly described above, has modified at least the latter aspect of critique.

Summary

TQM refers to a company's effort to continuously improve all areas of its organization. It serves to introduce quality as a system goal and to guarantee it permanently in all functional areas. TQM, which was developed in the Japanese automotive industry and finally turned into a successful model, needs full support of all employees in order to lead to success. The most common TQM concept in Europe is the EFQM model for excellence of the European Foundation for Quality Management, a model which offers a holistic, results-oriented approach.

Reward strategy; Total returns

Definition

Total reward is an approach to reward management that emphasizes the need to consider all aspects of the work of value to employees, not just a few, such as pay and employee benefits. It aims to blend the financial and nonfinancial elements of reward into a cohesive whole. Total rewards complement the organizational goals as well as values and culture, ensuring a highly effective realization of the business strategy. Total reward is of interest because it encompasses all types of rewards – nonfinancial as well as financial, indirect as well as direct, and intrinsic as well as extrinsic.

Introduction

Today it is more important than ever for organizations to have a strategic and integrated approach to rewards. Traditional rewards programs are typically financial in nature and must be at least at a baseline competitive level for companies to attract and retain talent (Bremen and Sejen 2012). The effectiveness of these traditional rewards programs, however, has not been established (see, e.g., Lawler 2000; Gerhart and Rynes 2003), as they produce higher labor costs, without insuring employee commitment and loyalty, two of today's most important goals. Apart from attracting and retaining talent, rewards must also increase organizational commitment, encourage employees to improve their skills, and motivate behaviors that raise performance levels in organizations (Lawler 2000). Employers now realize that this traditional approach to rewards, offering just competitive compensation and benefits programs, are insufficient when competing for talent, especially among younger employees (Towers Perrin 2005). Moreover, a growing number of employees, particularly from generations X and Y, are looking for development opportunities, a supportive work environment, reduced work-related stress, and better work-life balance (Bremen and Sejen 2012).

There is, therefore, a need for a more comprehensive approach to rewarding employees, such

as the total rewards concept (TR, also called total returns) that will help achieve organizational goals while meeting employee needs. TR that combines organizational goals and needs with employee expectations and preferences, therefore, creates high value for employees. **The aim of TR** is to maximize the impact of a wide range of rewards programs and instruments on employee motivation, commitment, and job engagement (Armstrong and Cummins 2011; Bremen and Sejen 2012; Anku-Tsede and Kutin 2013). Employers that create successful total rewards strategies meet employee needs and preferences while optimizing their investments around the most effective and attractive motivating instruments. This strategy also brings maximum return and builds effective employer branding (Anku-Tsede and Kutin 2013).

The total rewards concept is a comprehensive, holistic approach that is compatible with human capital and stakeholder theory and simultaneously aligns organizational and human capital strategy (Armstrong and Brown 2005; Beck-Krala and Klimkiewicz 2016). Human capital theory presents a holistic view of employees. This concept considers the expectations and needs of the main stakeholders of the organization – its employees. Particularly, it integrates organizational goals and values with employee expectations, needs, and values, instead of considering employees as merely valuable resources. Based on this assumption, total rewards view employees as important and essential assets who contribute to the present and future development and growth of the organization.

A traditional reward consists mostly of financial payment and emphasizes the function of extrinsic motivation, treating employees as resources necessary to achieve organizational goals. The TR approach, however, has an intrinsic focus on incentives and motivation and emphasizes employee initiatives and human capital development for a sustainable, competitive advantage. Therefore, TR is of interest because it encompasses all types of rewards – nonfinancial as well as financial, indirect as well as direct, and intrinsic as well as extrinsic. Moreover, selected rewards programs within the TR concept

complement the organizational goals as well as values and culture, ensuring a highly effective realization of the business strategy. Managers understand that most talented employees prefer to work for organizations that offer competitive pay as well as growth opportunities, a promising future, and a positive work experience. In this context, TR creates the employee value proposition (EVP), which describes the value employees derive from the organization. Thus, TR encompasses everything that employees value in their employment relationship. This includes both transactional and relational rewards, such as compensation, benefits, development opportunities, and a supportive work environment. These four components of total rewards comprise a tool kit for HR leaders to draw upon in constructing a comprehensive rewards program that will provide them with a competitive edge. Total rewards are the most visible elements to employees who make their employment decisions based on the overall attractiveness of the offer. Many employers on Fortune magazine's annual list of the best companies to work for in America embrace a total rewards strategy rich in relational rewards, such as flexible working arrangements, development opportunities, and engaging office perks to provide heightened visibility as a preferred employer in a tight labor market (Bremen and Sejen 2012).

Definition and the Idea of TR

Total rewards have emerged as a modern approach and gained attention in the 1990s (e.g., O'Neil 1998). However, this topic has been more developed in the practitioner literature than in academic works (Torre and Sarti 2013). Thus, many associations and consulting groups (e.g., WorldatWork, SHRE, Towers Perrin, etc.) have developed this approach which may have had an impact on the few scientific publications that explored a common definition of TR.

Armstrong and Cummins explain that "A Total Reward is an approach to reward management that emphasizes the need to consider all aspects of the work of value to employees, not just a few,

such as pay and employee benefits. It aims to blend the financial and non-financial elements of reward into a cohesive whole” (Armstrong and Cummins 2011, p. 45). In this context, total rewards build a strong employment value proposition, offering a wide and attractive range of motivational instruments. As such, WorldatWork defines total rewards as all of the tools available to the employer that are used to attract, motivate, and retain employees and includes everything the employee values from the employment relationship (www.worldatwork.org). In fact, most of the TR strategies offer attractive incentive programs that fulfill employee expectations and needs. Other TR definitions, apart from the comprehensive use of financial and nonfinancial motivational instruments, underline the strong integration with business and human capital strategy or simply organizational goals and boost to employee motivation (Lawler 2000). In this regard, total rewards are treated as a portfolio of integrated investments with various but complementary sets of purposes and desired outcomes (Bremen and Sejen 2012, p. 57). This definition shows the strong linkage of business, human capital, and TR strategies (Fig. 1). Many researchers agree that this makes employees feel valued and enhances the attraction and retention of talent committed to helping the company execute its business strategy (Kaplan 2007; Lawler 2000; Brown 2014). Some authors add that TR

strategy is vertically integrated with the business strategy and horizontally with other human capital strategies that help achieve internal consistency (Anku-Tsede and Kutin 2013).

Effective total rewards are designed to be an extension of the business strategy, explicitly supporting key priorities and goals and clearly communicating the level and nature of the contribution the organization expects from its people. Therefore, some researchers view TR as a strategy that represents more *responsible* rewarding (Klimkiewicz and Beck-Krala 2015), which is consistent with the approach of corporate social responsibility. Furthermore, it suggests basing rewards on the value that people bring to organizations and rewards people according to how effectively they use their knowledge, skills, and competencies to help organizations improve their business performance (Lawler 2000). While TR should develop from the business strategy, employers must ensure that the objectives of all elements within the total rewards package are aligned and support the main goals of TR (Fig. 2). Thus, total rewards are designed to effectively align the interests of key organizational stakeholder groups: customers, owners, and employees (Chen and Hsieh 2006).

This linkage model illustrates the results of rewards investment from inception to outcomes. It also helps identify rewards programs that influence desired employee behavior which drives desired customer behaviors, resulting in desired financial outcomes.

Total Rewards, Fig. 1 Integration of TR, business, and HC strategy. (Source: Based on Lyons and Ben-Ora 2002)

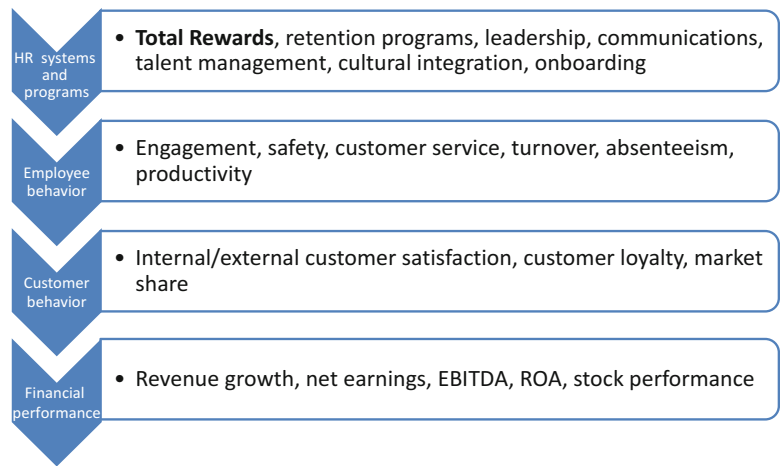

Main Components of Total Rewards

The model of total rewards appears to rely on the psychological contract and Rousseau’s (1995) distinction between reward elements, which are either relational or transactional. All models available in the literature include those two elements: relational or transactional. Relational rewards are identified as nonfinancial rewards, while transactional rewards are identified as tangible, financial, rewards (Armstrong and Cummins 2011). Tangible rewards focus on extrinsic motivation and arise from transactions

between employer and employee. Tangible rewards include base pay, variable pay (bonuses, incentives), and employee benefits. They are essential to recruit and retain employees but can, however, be easily copied by competitors (Armstrong and Brown 2005). Intangible rewards, also called relational rewards, focus on intrinsic motivation and show how employees are treated by the employer. They are nonfinancial in nature; however, they enhance the value and effectiveness of transactional rewards. Intangible rewards include opportunities for growth (learning and development, work experience) and a positive workplace and are important in developing and building engagement and commitment of employees (Armstrong and Cummins 2011; Chen and Hsieh 2006). This is shown in Fig. 3.

Although there are a few TR models in the literature that differ in specific components, all have the same general outline, as shown in Fig. 3. Most models presented contain four main elements: financial compensation, nonfinancial compensation, growth opportunities, and working environment (Armstrong and Cummins 2011; Chen and Hsieh 2006; Milkovich and Newman 2001). Some of the TR models are simplified and comprised of three main elements (e.g., the Towers Watson model, which consists of foundation rewards, performance-based rewards, and career/environmental rewards (Bremen and Sejen 2012, p. 59), or the Mercer Human Resources Consulting model, which includes pay, benefits, and careers (Gross and Friedman 2004). Other models consist of four components (e.g., the Zingheim and Schuster model or

Total Rewards,
Fig. 2 Linkage model.

the Towers Perrin model): total pay, positive workplace, individual growth, and a promising future (Armstrong and Cummins 2011, p. 47; Chen and Hsieh 2006, p. 66).

The TR elements, as presented in Table 1, are interdependent and may have different values and importance to every employee. The aim of a total rewards approach is to provide employees with a combination of monetary and nonmonetary rewards to motivate them to maintain a level of desired business performance. This rewards strategy enables employees to manage their lives more easily while maintaining focus on their jobs. The components are integrated and chosen deliberately to complement each other and strengthen employee motivation. Thus, financial rewards provide financial security, ensure compliance with regulations, and attract and retain employees. Nonfinancial rewards motivate employees and create desired staff attitudes, such as commitment, and help achieve high performance and appreciation of that performance. Next, growth opportunities support professional development and self-realization, as well as influence loyalty and a desire to remain with the organization. Finally, work environment creates long-term employee well-being, engenders loyalty, gives a sense of safety, and helps in better balancing work and family responsibilities (Beck-Krala and Klimkiewicz 2016).

Popular TR models can be found in the literature, such as those proposed by Zingheim and Schuster or Armstrong and Brown, whereas, in practice, most popular are those presented by professional organizations, such as Towers

Perrin, Hay Group, WorldatWork, Aon Hewitt, or Mercer Human Resources Consulting. An interesting model that may be also dedicated to organizations representing the public sector was the one presented by the Hay Group in cooperation with the Cabinet Office in the UK. This model proposed six components: quality of work, work-life balance, tangible rewards, inspiration/values, future growth opportunity, and an enabling environment (UK Cabinet Office 2007). Another interesting model is presented by the American WorldatWork, which focuses on six main components, subdivided into smaller subgroups, as specified in Table 2.

Designing and Implementation of Total Rewards

Every organization needs to adopt a model that best fits and is tailored to its specific characteristic and the needs of its main stakeholders – employees. When designing TR strategy, it is important to remember the external and internal organizational environment that influence TR. External influences are characteristics of particular countries or regions and include the global economic landscape (e.g., labor market trends), cultural norms, and legislative aspects. For example, in developing countries, more impact will be given to transactional (financial) rewards, as financial rewards are more valued by employees in such countries, whereas employers in developed countries will focus more on relational rewards (Anku-Tsede and

Total Rewards, Table 2 WorldatWork model of total rewards

Total rewards	
Compensation	Base wages (e.g., salary pay, hourly pay, piece rate pay), premium pay (e.g., skill-based pay, weekend holiday pay), variable pay (e.g., commissions, bonus programs, short- and long-term incentive programs), severance pay, and outplacement services
Benefits	Legally required benefits (e.g., social security), health and welfare (e.g., medical plan, life insurance), retirement (e.g., defined benefit plan), pay for time not worked (e.g., vacation, holiday), voluntary benefits (e.g., parking), perks (e.g., company car)
Work-life effectiveness	Workplace flexibility (e.g., teleworking, flex time), paid and unpaid time off (e.g., sabbaticals, maternity/ paternity leave), health and wellness (e.g., employee assistance program), community involvement (e.g., CSR/green initiatives), caring for dependents (e.g., special needs care), financial support (e.g., financial wellness program, culture change initiatives (e.g., diversity initiatives, work environment initiatives)
Recognition	Recognition (e.g., service award, yearly awards)
Performance management	Performance (e.g., performance reviews, pay alignment and connection with rewards)
Talent development	Learning opportunities (e.g., on-the-job learning), coaching/ mentoring (e.g., leadership training), advancement opportunities (e.g., internships, succession planning)

Source: Based on the WorldatWork Total Rewards Inventory (www.worldatwork.org)

Kutin 2013). Then, among the most important internal factors that influence TR strategy are business strategy, human capital strategy, organizational culture, employees of the organization, etc. To enhance employee value, some TR components – such as benefits – are offered **cafeteria style**. This allows employees to create a TR package best suited to their own requirements. Individually created TR packages are tailored to specific employee needs and preferences and, therefore, have strong impact on employee behavior and engagement. The overall value of TR offered to specific employee groups is set by the employer, but the individual packages employees choose for themselves contain what is most important and valuable for them. These flexible benefit plans allow employees to decide, within certain limits, what best suits their needs.

Creating an adequate and effective total rewards program is not easy; however, there are some recommendations provided in the literature to guide professionals. Professionals note three important issues crucial to the design of effective TR strategies:

- Understanding real employee expectations and preferences.

- Understanding the relationship between total rewards and the employee value proposition.
- Understanding how to develop programs and balance costs and employee value.

The first issue seems simple enough to most employers; however, practitioners underline that understanding employee expectations is not always easy. Often, employees are not sure about their preferences, managers do not know what employees really want, and sometimes employers ask wrong or misleading questions. Thus, when conducting employee surveys, it is important to ask about specific choices rather than asking open-ended questions (Bremen and Sejen 2011). Despite conducting frequent surveys of employee preferences, many employers find a mismatch between what employers believe employees want and what employees really prefer. Moreover, employers are supposed to understand employee preferences, taking into account key demographics to ensure alignment of TR. Professionals also add that TR strategy needs to be based on hard facts and quantitative analysis, which will help create an adequate package that not only meets employee expectations but also optimizes cost (Bremen and Sejen 2012).

Furthermore, developing and implementing a total rewards strategy requires strong **engagement of top management**. Managers must ensure that the organization will provide employees with the most suitable combination of a reward mix. That means that the right employees will be supported with the right rewards programs and instruments, in the right time and for the right reason (Anku-Tsede and Kutin 2013). These rewards programs offered within TR must be linked to organizational goals that will be achieved by specific employee behaviors that will be rewarded. Moreover, these rewards must be valued by employees (according to the Vroom theory) and also perceived as fair and equitable (according to the Equity theory). Managers must understand employee preferences and values in this area (often preceded by an employee survey). Besides involving employees in the process of developing TR, the survey may increase their acceptance of TR and commitment in the implementation process. Another crucial aspect in implementing and administering TR is open communication on the TR strategy. Complete information about the available rewards programs and their values to employees must be provided to all employees, as this will promote equity and trust, as well as commitment (Rickard et al. 2016; Thompson 2002; UK Cabinet Office 2007).

When designing the TR strategy, some may use the **seven-step process** proposed by Gross and Friedman (2004, p. 10). These steps are as follows:

- Defining the context and issues which focus on clear understanding of the key factors both outside and inside the organizations that affect business and human capital decisions.
- Setting the total rewards strategy which provides a strategic agenda and principles for creating the programs and package.
- Developing an agenda for a holistic assessment of the existing rewards strategy and creating alternative programs if changes in TR are required.
- Creating an implementation plan for TR concerning time, budget, major communications, etc.

- Designing an individual plan that gives a wider perspective as to how TR supports individual employees and their expectations.
- Implementing the process by publicizing it to employees and educating management personnel as to how they can use the program to achieve results for personal success and company goals.
- Measuring and managing TR strategy to ensure that the organization does indeed reward what it plans to reward and achieves desired goals, evaluating the program's effectiveness, and making necessary changes to further achieve goals.

It is crucial to clarify the concept and objectives of TR strategy at the beginning of implementing TR within the organization, and most practitioners indicate the crucial role of effective communication in this process. Involving stakeholders in developing TR is another important aspect. Not only lower-level employees but line managers as well can contribute significantly to the effectiveness of the TR package. Above all, it must be monitored and evaluated to realize its value. To decide which outcomes of a total rewards system should be measured, it is useful to revisit the system's objectives and then consider which data sources will provide the information needed to evaluate those outcomes (Heneman and Coyne 2007).

Benefits of Total Rewards

Benefits of a TR strategy accrue to the organization and its shareholders – clients as well as employees. It is important to remember that effective TR programs are holistic and integrated to be aligned with the organization's unique strategy. Therefore, total rewards programs support key organizational priorities and goals and communicate the main requirements and contributions the organization expects from its employees (Bremen and Sejen 2012). Total rewards can help the organization achieve important goals, such as meeting varied and changing employee needs by

introducing more value, choice, and flexibility and enhancing employee engagement by promoting a culture that values and rewards outstanding performance (Morris 2006). Moreover, TR builds positive employer branding for both internal (e.g., managers and employees) and external stakeholders (clients, potential employees). In terms of clients, because satisfied and engaged employees provide high-performance and high-quality customer service, TR ensures responsible employee behavior toward clients. Then, for employees, TR creates employee safety and satisfaction. Financial and nonfinancial rewards, including training and development opportunities, flexible schedules and recognition, and even providing vehicles for employee transportation, create employee well-being and add convenience to their daily lives as well as sending a more caring message to employees and engendering their loyalty (Chen and Hsieh 2006). TR seems particularly important for younger employees, for whom flexibility and both nonmonetary and monetary rewards are important in strengthening employee initiative. Furthermore, total rewards may enhance employee work happiness (Gulyani and Sharma 2018).

When considering possible benefits connected with total rewards, researchers noticed that effective and strategic total rewards programs can:

- Create affordable and sustainable costs of the total rewards package through accurate decisions concerning where to invest rewards money, which is possible by examining employee expectations and priorities (Gross and Friedman 2004).
- Have a deep and long-lasting impact on motivation and commitment of employees (Armstrong and Brown 2005).
- Create a positive psychological contract (Anku-Tsede and Kutin 2013).
- Develop flexible plans to encourage employees to stay longer in the organization and help in recruiting new employees (Griffin 1999).
- Connect with the business strategy to create a high-performance culture (Gross and Friedman 2004, p. 9).
- Generate maximum returns on the rewards program investment which is systematically measured and assessed (Gross and Friedman 2004, p. 9).
- Support the *employment brand* through effective communications and enhancing desired employee attitudes and behaviors (Gross and Friedman 2004, p. 9).

To sum up, effective TR strategy supports a sustainable competitive advantage through guiding long-term, sustainable programs that build employee well-being and positively influence employee behavior which drives customer satisfaction. Finally, customer satisfaction results in revenue growth and profitability for the organization.

Summary

Many organizations operating in a highly competitive environment design and implement TR strategies. The popularity of this approach is a result of its highly efficient maximization of employee benefits and optimization of employer costs while implementing the business strategy. For most employers, it is a way of becoming an employer of choice and achieving a sustainable advantage. Despite the fact that this concept has existed in the literature for a decade, little research has been done and few case studies exist. Most available case studies are connected with industry examples. It would be highly important to present and provide a guide to developing and implementing TR strategy for both private and public sector organizations.

Tracing Corporate Governance to Its Roots

Selina Neri

HULT International Business School, Dubai
Internet City, Dubai, United Arab Emirates

Definition

Corporate governance can be defined as a corporation's operating system (Gilson 2018). The modern notion of "ecosystems" (Moore 1993, 1996) provides an appropriate metaphor to describe the range of value creating interactions and relationships among the key actors of governance, or the individuals and organisms who are assigned key roles in the governance of corporate affairs. The term corporate governance dates back to the 1970s and was coined in the wake of corporate scandals (Ocasio and Joseph 2005). Ralph Nader proposed one of the earliest available definitions, borrowing elements from democracy as a form of governance and applying them the "governance" of corporations. *The Taming of the Giant Corporation* (Nader et al. 1976) defines corporate governance as being about limiting the abuse of power of large corporations. Other scholars, business leaders, and institutions followed suit and elaborated their own definitions of governance, contributing to establish a vocabulary of corporate governance.

Language and vocabulary are generally the products of human activity and follow the evolution of human affairs. Corporate governance is no exception and its definitions appeared in the wake of societal and environmental changes taking place between the 1930s and the 1970s in the cultural and political economic make-up of companies and markets. Since 1976, definitions of corporate governance have evolved depending on viewpoints (Aguilera et al. 2015; Tihanyi et al. 2014) and reflect the specific focus and interest of society in corporate activities. Fundamentally, governance is concerned with the structure of rights and responsibilities among those holding a stake in a company (Aguilera et al.

2016a; Aoki 2001) and the essence of corporate governance is rooted in control over corporate activities and shareholder protection. More recent views have started to regard governance beyond control, or as a mechanism to ensure that corporate power is properly channeled to the benefit of society (Judge and Talaulicar 2017). These perspectives take the core of governance beyond control to embrace the overall corporate contribution to society. Between these two opposite poles other definitions of governance exist. These include "the determination of the broad uses to which organizational resources will be deployed and the resolution of conflicts among the myriad participants in organizations" (Daily et al. 2003, p. 371), "the structures, processes, and institutions within and around organizations that allocate power and resource control among participants" (Davis 2005, p. 143), and, more broadly, "the collection of rules, policies and institutions affecting how a firm is controlled" (Donaldson 2012, p. 257). *Corporate Governance: An International Review* (CGIR), one of the leading academic journals in the field, offers one of the broadest definitions and views governance as being about "the exercise of power over corporate entities so as to increase the value provided to the organization's various stakeholders as well as making those stakeholders accountable for acting responsibly with regard to the protection, generation and distribution of wealth invested in the firm" (CGIR 2019).

Introduction

The twenty-first century is characterized by disruption at social, political, environmental, and financial level. Despite economic, technological, and social progress, humanity faces "overwhelmingly important challenges" (McGahan 2019, p. 10) that entail a high degree of change only destined to grow (United Nations 2016). Between the twilight years of the twentieth century and the dawn of the new millennium corporate governance became an institutionalized field of activity for corporations, governments, investors, and scholars in the United States and throughout the

world. Although what has become known as *corporate governance* is a field of study and a business practice that focuses on issues of operation and control of corporations as commercial entities, the term *corporate governance* and its ecosystem of formal and informal definitions, charters, codes, laws, rights, and responsibilities of the actors (individuals and organisms) legally tasked to govern a corporation only emerged in the 1970s. Since then, following major corporate scandals, the dot.com boom of the late 1990s and the financial crisis of 2008, the concept of corporate governance has evolved considerably. These changes in meaning have had major implications for organizations and institutions both politically and economically. To trace corporate governance to its roots it is important to review the evolution of governance to its contemporary forms.

Tracing the Roots of Corporate Governance

To trace corporate governance to its roots, a good starting point is the consideration of fundamental, historical changes that have taken place in corporate law. Historically, only by the 1900 every major jurisdiction in the world had converged to offer as a minimum one standard form of legal incorporation with five key peculiarities: legal personality, limited liability (of managers and owners), investor ownership, transferability of shares, and delegation of management activities under a board of directors (Kraakman et al. 2004). Through legal personhood the corporation had acquired and developed a separate life, no longer identifiable with that of its owners. Owners and managers started to become more and more separate and distant (Mark 1987) and the board of directors emerged to represent the bridge between the two. In most jurisdictions, since the dawn of the twentieth century, this basic structure has remained unchanged (Hansmann and Kraakman 2000). Ever since the creation of corporate personhood, corporate law academics have debated the obligations of those who direct and make decisions on its activity (Letza et al. 2004; Wallman 1999). In the 1930s, in the United States,

the famous “Berle-Dodd dialogue” discussed to whose interests the powers granted to a corporation should be exercised. This debate has great historical relevance (Weiner 1964) and to this day possesses an active voice. The dispute started with the argument that the powers granted to a corporation are to be exercised in the interests of its shareholders (Berle 1932). In the traditional legal view, a corporation is an alliance of shareholders “formed for their private gains” (Dodd 1932, p. 1147). However, Dodd also posited that “it is undesirable (...) to give increased emphasis (...) to the view that business corporations exist for the sole purpose of making profits for their stockholders” (Dodd 1932, p. 1148), a recognition that corporations also possess a social function. Consequently, a view of corporate governance began to emerge as the mechanism to maximize shareholder value while recognizing the expectation of a corporate contributing to society.

Ever since the famous Berle-Dodd dialogue, the main actors of corporate governance include the board of directors, managers, and shareholders (Aguilera et al. 2016b). Nowadays, in most legal entities with a governance requirement, a group of people typically known as the board of directors have responsibility for monitoring the activities and strategic direction of the company in the interests of shareholders and of other stakeholders. Boards represent the highest legal authority of the corporation (McNulty et al. 2013; Starbuck 2014) and sit at the apex of corporate power. Although boards have a key governance role (Almandoz and Tilcsik 2016; Baysinger and Butler 1985), in practice they usually delegate most activities to management (Berle and Means 1932; Hillman and Dalziel 2003; Judge and Talauecar 2017). Nonetheless, governance systems do exist (such as the Netherlands or Switzerland), where the responsibility for managing and governing a company is codified in law and cannot be delegated to management.

The Evolution of Corporate Governance

Directors have legal responsibilities, and over time their roles have evolved, resting either on

the foundation of governance (monitoring) or on the evolution of its definitions (resource provision, service, and strategy) (Boivie et al. 2016; Judge and Talaucar 2017; Klarner et al. 2018). At the heart of governance is agency theory, and the key concepts of agency problem and shareholder interests (Aguilera et al. 2016b; Daily et al. 2003; Filatotchev and Boyd 2009; Van Ees et al. 2009). Since 1932, boards of directors have been the focus of attention. At the time, a number of problems were raised with the public corporate structure and the separation of ownership and control (Berle and Means 1932). About three decades later, Jensen and Meckling studied the ownership structure of the corporation, the separation of ownership and control, and the problem of aligning the interests of managers and shareholders who own the corporation (Jensen and Meckling 1976). The agency relationship remains among the most common and oldest modes of interaction of human beings (Ross 1973). Almost any contractual relationship featuring a party (agent) promising performance to another (principal) is subjected to what is known as the “agency problem.” In essence, the problem boils down to information asymmetry between the two, the agent having better information than the principal. Under the assumption of self-interested behavior on the part of agents (Bosse and Phillips 2016), the potential for wrongdoing increases when interests diverge (Dalton et al. 2007). This assigns the principal a position of weakness, as he/she cannot, without cost, ensure that the agent’s performance is what was promised. Consequently, costs arise out of the necessity of monitoring and controlling agent’s activities (Kraakman et al. 2004). Agency theory views shareholders as principals (Jensen and Meckling 1976) and boards (and their directors) as first-order agents (Eisenhardt 1989) with managers acting as second-order agents. The key concern of agency is how, through the monitoring role of boards shareholders can control their agents’ behavior to ensure the principals’ interests are protected. Boards are fiduciaries of the principals and through the board collective management of the conflicts between shareholders and managers, companies can perform better (Dalton et al. 2007).

Traditionally, boards perform two broad roles: monitoring and resource provision (Hillman and Dalziel 2003; Hillman et al. 2008), however this role set up has evolved (Machold and Farquhar 2013). Traditional board monitoring and resource tasks may be complemented with service and strategy roles (Stiles and Taylor 2001; Zahra and Pearce 1989), or substituted with monitoring and service roles (Judge and Talaucar 2017). In agency tradition, shareholder value maximization, incentives, and board independence are among the “mantras of corporate governance” (McNulty et al. 2013, p. 183). Gradually, alternative and complementary approaches have been developed to study governance and its actors, for instance, institutional, stakeholder, or resource provision theories. Topics such as management and board compensation, two tier board systems (where the chair of the board and CEO roles are separate and held by different individuals) and the relationship between governance structures and financial performance have drawn the lion share of interest among governance scholars, legislators, and the media (Cuomo et al. 2015). The board monitoring is inward looking. To curb or limit self-interest, board controls, incentives and contractual relations are available as mechanisms to restrict and control agents’ power to act in ways that diverge or damage principals’ interests (Mitchell et al. 1997). Contracts, in particular, are the “unit of analysis” (Eisenhardt 1989, p. 58) of corporate governance and efforts are geared toward identifying the most efficient contractual arrangements to govern the principal-agent relationship. Studies have shown that boards give priority to maximizing shareholder’s wealth, optimizing agency costs, nominating and compensating executives, and financial auditing as core activities to protect and enhance shareholder value (Baysinger and Butler 1985; Daily et al. 2003; Fama and Jensen 1983; Kosnik 1987; McNulty et al. 2012) but are also increasingly occupied with corporate purpose and value creation (Bezemer et al. 2018; Federo and Saz-Carranza 2018; Roberts et al. 2005).

The rationale for the evolution of corporate governance from a mechanism of control over business activities in the interests of shareholders to a broader mechanism for also channeling

corporate power to the benefit of society follows an evolution in the expectations of corporate accountability toward society and toward those holding an interest or stake in a company. Motivated by a variety of concerns, such as product quality and safety, disclosure of sustainability practices, transparent and audited financial reports, and value creation for society as well as for investors, scholars, governments, legislators and investors have gradually defined and set out in soft (codes) and hard law (regulation) additional responsibilities for board of directors and shareholders.

In this regard, a remarkable evolution in the governance role of shareholders is worth noting. This evolution is linked to the evolution of finance from the nineteenth-century Rockefeller and Carnegie heroes of money promotion, investment, and management, to professional managers of corporations, owned by shareholder investors, in the first half of the twentieth century (Clark 1981). Ever since, the world is in the age of “intermediated finance” (Rock 2018, p. 364), with separate savings and investment decisions, paving the way for professional investors, the money managers, also known as “institutional investors.” In investor capitalism and liberal economies, institutional investors play a powerful role (Goyer and Jung 2011; Hertig 2018; Rock 2018; Useem 1996), and the share of corporate equity investments held by these investors has increased significantly both in the size and concentration of their stakes (Coates 2018; OECD 2015). Historically, shareholders have delegated the governance of corporations to their elected boards of directors. Following societal demands for investors to get closer to their investee companies and positively influence corporate conduct, investors increasingly engage in the governance of corporations (Gillan and Starks 2007), exercise voice (Hirschman 1970) on corporate matters, and actively seek to influence financial, environmental, and social performance, in the form of activism (Cai and Walkling 2011; Cundill et al. 2018; Ertimur et al. 2010; Goranova and Ryan 2014).

Tracing the roots and evolution of corporate governance indicates that the corporation is much more than a few pieces of paper filled

with legal jargon. Consequently, corporate governance has become much more than the structure of rights and responsibilities around the corporate personhood. Governance has evolved into the ecosystem of structures, processes, and ways of doing things that enable a business to operate in the interests of its investors, employees, customers, suppliers, governments, and society at large. In other words, governance has evolved toward being about channeling corporate power to the benefit of society. Some of these structures and processes are rooted in corporate law, while the majority “is not legal at all” (Gilson 2018, p. 7), rather it relates to the web of relationships, power sources, information processes, decision making and control, support and advice that make up the ecosystem of corporate governance. The corporate legal skeleton and its governance represent the bare minimum of how a corporation operates, while all other elements of the governance ecosystem represent the most important part or the dark matter of corporate governance. In this ecosystem one can find the labyrinth of relationships, formal and informal controls, organizational charts, sources of influence and support that never appear on corporate websites, corporate governance codes, or charters. It is this governance ecosystem that constitutes the real operating system of a corporation, a working system on which sustainable value creation for investors as well as for society depend on.

Traditional and New Sustainable Production Methods in Food Industry

Ruhan Aşkın Uzel

Food Processing Department, Yasar University,
Bornova-Izmir, Turkey

Synonyms

Food industry; New food production methods; Sustainability; Sustainable; Sustainable food processing; Traditional food production methods

Definition

Traditional foods are necessary for people to meet their vital needs (Hossain et al. 2018). They are the symbols of culture, and they have been consumed for many years from one generation to another. They also may contain a historical texture or a national dish, or at least the materials used in the dishes may be culturally specific. So, they may express the level of cultural development of a society (Inglehart 2018; Bagelman 2018). Most of them are produced using traditional production methods. The traditional production methods can be used at the household level for small amount of food or for specific traditional foods to keep or enhance specific properties of food (Song et al. 2016; Ekpa et al. 2019). However, modern foods are the foods that are produced by using modern food production methods in which the food products reflect the style and approach of the food professional and are possible to be served in different forms according to the desires of consumers (Ettlie 1983; Mozaffarian et al. 2018). Hence, it can be stated that there is a cycle, starting from the raw materials to be used in the production of traditional foods, through to the end products, which are then developed according to the feedback from consumers regardless of whether the food is traditional or modern. Therefore, production methods need to be carefully designed, implemented by well-qualified teams, and must

obviously be appropriate for the materials being used depending on the food characteristics (Meghwal et al. 2017; Shegelman et al. 2019). For some food products, such as handmade foods, grains, fermented foods, etc., the use of traditional production methods may be the only choice. On the other hand, some food products can be produced with the use of new techniques depending on the possibilities available. Burgers, milkshakes, genetically modified foods, and frozen foods are some examples of modern foods (Sharmaa et al. 2020). In fact, the aim is to produce sustainable food of reasonable quality, depending on whether the food is traditional or modern and the method used in food production, because sustainability also aims to produce sustainable goods without compromising the quality (Movilla-Pateiro et al. 2020). For this reason, both the material used and the sustainability of the applied method will make the produced food sustainable. Hence, the concept of sustainability can be considered an emerging technique for the production of food materials (Lang and Barling 2012; Miranda et al. 2019).

Introduction

In the world economy, the food industry is of great importance to economic development and industrialization (Hediger 2000; Sexton 2000). At the same time, labor is obviously necessary for the production of food products. Hence, the establishment of food processing cycle should be in harmony with the variety and amount of materials to be used in the production, needs in public nutrition, technical facilities, and labor demand. For example, in order to produce a nutritional supplement beverage, the material to be used in production should be continuously available, the product to be produced should contain essential nutrients, the production area should have sufficient equipment, and labor delegation within the company should be well organized (Griggs et al. 2013; Tanumihardjo et al. 2019). Therefore, the food industry has great organizational, strategic, and economic importance for all countries (Pinstrup 1994; Spink et al. 2019).

Today, a number of environmental problems beset the world such as climate change, reduction of ecological and biological diversity, and air-water-soil pollution. These problems can lead to complexity in the plans of companies and institutions to produce food and to develop new production methods, because the climatic conditions and nutritional sources required for the growth of agricultural materials used in food production will show inconsistency (Hosseini-Fashami et al. 2019). In this context, the concept of sustainability has gained importance in the food sector. Sustainability can be defined differently depending on the subsectors such as food, chemistry, agriculture, textile, construction, environment, etc. In general terms, most of the definitions about sustainability include the concepts of continuity in diversity and increase in efficiency (Salvioni and Gennari 2016). To serve the aforementioned concept of sustainability, sustainable production in the food industry aims to produce goods by using traditional and new production methods depending on the nutritional profile of the foods, characteristics and the needs of costumers (Nenni and Micillo 2017). In order to achieve this without harming the balance of nature and using resources effectively, it is necessary to manage the synergy between sustainability factors such as the economic dimension, environmental dimension, and social dimension (Fig. 1) (Despotovic et al. 2016; Lutz et al. 2002). As seen from Fig. 1, the intersections of these three factors result in new concepts that are important for sustainability, such as a sustainable economy, social equality, and the local environment. Sustainable change is the common point of all of these. In the figure, the economic dimension of sustainability is related to the use of limited resources to produce goods (Geiger et al. 2018). An economically sustainable system can produce goods and services within the frame of sustainability and can avoid sectoral imbalances that harm industrial production (Aydin 2015). The social dimension of sustainability is human-oriented and has importance with regard to social and cultural continuity (Hanif et al. 2017). The environmental dimension predicts a balance between biological and physical systems. The main objective is to ensure that these systems

can be adapted to changing conditions. Biodiversity and conservation of this becomes important in this regard (Murgado-Armenteros et al. 2020). Environmental pollution, which causes irreversible damage, results in a loss of biodiversity which has a negative impact on the food sector. These include food-related problems such as food-related illnesses, decrease in production yield, loss of food quality, destruction of natural resources, dependence on imported food products, migration from rural areas to cities as a result of changing nutritional status, and the destruction of rural communities (Nabi et al. 2019). These factors all impact sustainable food production in various ways. For example, there may be a reduction in variety of plant-based raw materials to produce plant-based food products due to inappropriate climate conditions or due to the pesticide-borne illnesses in these plant-based raw materials, so it may also cause a decrease in food product variety (Egal and Forster 2020). In addition, it should be noted that almost all traditional and new food production methods that have gained current popularity are based on sustainability principles (Kopczyńska 2020). Therefore, it is essential to follow sustainability principles in food production and to evaluate basic principles of food production methods in order to make sustainable change successful (Galanakis 2018).

The food industry is a large field where these sustainable change elements can be applied (Aguilar et al. 2019). Green production practices cover both traditional and new sustainable food production methods, and in this sense, they have a large share in food production (Rueda et al. 2017). These practices can improve food product quality and accuracy in measurement and analysis, and prevent or minimize environmental damage to an acceptable level. They are obviously preferred because of the threat of depletion of natural resources for food production (Shouket et al. 2019).

In this context, when considering sustainability in food production, cuisine should not be ignored due to their common point to reflect the interaction between culture and technology, such as development of traditional and modern food production methods, investigation of new types of

Traditional and New Sustainable Production Methods in Food Industry,

Fig. 1 Sustainability factors in food industry (Leat et al. 2011)

food and service styles by experts, etc. Therefore, it is possible to evaluate the cuisine into two groups such as traditional foods and new (modern) foods (Sozer et al. 2017). Traditional or new foods can also create various subsegments, depending on whether the methods they are produced are traditional or new. Sometimes, it can even be seen that these methods are blended with alternative techniques (Okumus 2020). For example, the extraction method is a sustainable method used to obtain food extracts. As well as traditional applications such as extracting foods by holding the food material in hot water for a certain period of time, the method has new uses in systems developed with the support of temperature and pressure depending on food characteristics. Hence, traditional foods and modern foods may intersect in terms of product and production techniques (Johnson et al. 2018).

Traditional food products can reflect the historical, cultural, geographical, agricultural, and climatic heritage of society according to the characteristics of the material used in their production (Fatorić and Seekamp 2017). If traditional food is produced, traditional reflections can be seen in the presentation, consumption, and storage

conditions of the food. For example, if the produced food needs to be stored in a wooden container, the presentation and consumption styles can be planned in accordance with that material (Turck et al. 2016). In recent years, new sustainable methods have been used in addition to the use of sustainable traditional methods for the production of traditional foods. The possible reasons for that can be macroeconomic developments, changes in consumer behavior, innovations in food technology, the supply and demand balance, etc. (Voinea et al. 2020). Hence, the concept of sustainability is becoming an important part of life, from the consumed food to the materials used and even consumption habits (Petrovič and Murgaš 2020). In this context, regardless of whether the food or food production method is traditional or new, the main thing is to apply the sustainability principles efficiently. Accordingly, this entry will discuss traditional and new sustainable techniques used in food production.

Importance of Sustainability in Food Production

Sustainable food production is of great importance for the future of the world and for raising

healthy generations (Movilla-Pateiro et al. 2020). Likewise, the use of renewable energy sources in the food industry to avoid energy dependence and damage to ecosystems is a priority issue (Petersen 2016; Murphy et al. 2004). This is important both to reduce the environmental burden as well as production costs. At the same time, traditional and new production principles have started to follow the principles of green engineering applications in order to achieve sustainability in food production (Abualfaraa et al. 2020).

There are 12 basic principles in the green engineering approach (Ivanković et al. 2017). Many technical factors, from the design of new products to the provision of new materials, and from environment to human health within the scope of sustainable food production, can be evaluated according to these principles (Table 1) (Anastas

and Zimmerman 2003). The principles contain factors such as efficient energy consumption, importance of balance between inputs and outputs in the production area, waste treatment, design for sustainability, etc. They express key points to achieve sustainability by protecting the environment and by increasing production efficiency. Unfortunately, the food system struggles with climate change, deforestation, pollution, and exploitation of some animal and plant species (Myers et al. 2017). Sustainability is a solution to deal with these problems (Abualfaraa et al. 2020). Therefore, many subsidiary sectors starting from the raw material supply to the food production, including logistics, textile, chemistry, and information technology, contribute to food sustainability on a global scale, regardless of whether their production methods are traditional or modern, and

Traditional and New Sustainable Production Methods in Food Industry, Table 1 Twelve basic principles of green engineering (Kolb 2017; Sheldon 2016)

Number	Concept	Basic information
1	Inherent rather than circumstantial	Officials involved in production should make efforts to ensure that the materials used, the factors that make up the energy inputs and outputs, are not dangerous
2	Prevention instead of treatment	It is more advantageous to prevent the formation of waste rather than to clean it once it has been formed
3	Design for separation	Separation and treatment processes should be planned to ensure effective energy consumption by material use
4	Maximize efficiency	The entire production system, including products, should be planned to improve production quantity, use energy and time effectively, and increase efficiency accordingly
5	Output-pulled versus input-pushed	The product, the mode of manufacture, and the system should be based on the principle that the inputs must be known and the inputs designed accordingly, not the inputs and the results measured
6	Conserve complexity	The confusion and entropy embedded in the system should be considered as an investment to make the system more usable and waste-recyclable
7	Durability rather than immortality	Targeted durability should become the goal in the design of production, not immortality
8	Meet need, minimize excess	Design for excess or unnecessary capacity should be considered a design inefficiency
9	Minimize material diversity	The diversity of materials in multicomponent products should be minimized to enable efficient use of resources
10	Integrate local material and energy flows	The production steps of the products and the system design and material flow must be arranged in a harmonious manner
11	Design for commercial “afterlife”	Products, processes and systems as a whole should also be designed to enable commercial sustainability.
12	Renewable rather than depleting	Inputs in production (materials, raw materials, energy, etc.) should be designed by selecting them in the reusability philosophy rather than just consumption option

show their efforts to ensure that nature remains in sustainable balance. Hence, the food industry should also be one of the stakeholders (Franceschelli et al. 2018).

Innovation in Sustainable Food Production

Innovation in the food industry focuses not only on the food product but also on process, company structure, capacity, and speed (Rajapathirana and Hui 2018). This concept emerges as a result of the organizational development process where R&D and entrepreneurship have been combined with quality, effective leadership, appropriate employee management, and strategic marketing management factors. This will lead to an increase in production efficiency in the food chain. Moreover, the food industry will therefore be seen as an innovative sector producing high-quality food products by using appropriate production methods (Nazzaro et al. 2019). Food innovations include the developments in both traditional and new production methods such as innovations in frozen-storage, ionization, radiation, chemical-storage, vacuum or modified atmosphere packaging, food preservation, etc. These innovations can be applied to the food production lines depending on the characteristics of food, facilities in equipment, the level of technical knowledge, type of food production method (whether it is traditional or new), and the level of development in sustainability, so the adaptation of these innovations to the food production in order to achieve sustainability may differ from one country to the other (Romeiro 2012; Cappellesso and Thomé 2019). Some of these innovations are done for the development of traditional food production methods for specific types of food, while the others are for the exploration of new food products and new production methods. For example, a type of a snack food may retain its traditional appearance even after years because there is a certain customer segment that wants to purchase that food because of its traditional appearance, which can be considered as nostalgic. However, it may be possible to produce this traditional snack food product with a new method, which is faster, suitable for mass production, while maintaining the same appearance. Therefore, innovation in food production

can be done for various reasons such as the need to develop the technical characteristics of food, to preserve the food quality, to maintain sustainability in food production, to provide an advantage from cost variability by creating added value to the food product, and to protect the environment (Franceschelli et al. 2018). However, the innovation performance of a food company depends on its past experience, capacity, production and trade performance, etc. (Fig. 2) (Muller 2012; Laforet 2013).

As can be seen from Fig. 2, factors affecting innovation can be grouped depending on the sectoral status, the company profile, and technical knowledge. In this age of rapid development, R&D expenditures in the food industry need to be increased in proportion to the changing needs of consumers. In fact, when factors such as human resources, technical capability, and investment are evaluated, it can be said that the food company has enough capacity for innovation (Dzillas and Blind 2019). Therefore, awareness of the efficacy of innovation in the sector needs to be increased to profit from this capacity, using factors such as age groups, nutritional habits, working patterns, and performance. In addition, it should be noted that regardless of whether the technique used in food production is traditional or new, old technology should be replaced with innovative ones in order to progress in the line of sustainable food production and to meet the food need quickly (Millar et al. 2018).

Green Production in Food Industry

Green production can be defined as a production process that eliminates risks to human health and the environment and increases productivity by applying sustainable approaches in a holistic manner (Baines et al. 2012). The green production can also be described as the development of production technologies which do not produce greenhouse gas emissions, which do not produce toxic substances, and which do not produce waste (Conway 2019). The production process consumes fewer resources with less energy, reduces unnecessary packaging usage, and minimizes waste (Biner 2014). The green production results in green products that do not endanger human or animal health and are produced with

Traditional and New Sustainable Production Methods in Food Industry, Fig. 2 Factors affecting innovation (Jegade et al. 2012)

Traditional and New Sustainable Production Methods in Food Industry, Fig. 3 Clean production elements (Misra 2012)

environmentally friendly sustainable techniques. While maintaining quality, these products should also be recyclable (Krystallis and Chryssohoidis 2005). Hence, green products do not endanger human or animal health and are produced with environmentally friendly sustainable techniques. Sustainable food production methods and the green production methods are intertwined with clean production methods, so both the approaches may be grouped under clean production principles (Hens et al. 2018; Bera and Sadowska 2020). The basic building blocks in the clean production are shown in Fig. 3.

As stated in Fig. 3, environmental strategy is addressed under two sections such as system inputs and outputs. These are all selected aspects of integrated environmental management. The elements that make up the environmental strategy should be permanent, preventive, and integrative. The strategic approach strengthened in this way will provide robust products, processes, and services as output. In other words, the approach laid on the basis of clean production principles will bring efficiency in food production. At this point, as in every production process, increase in efficiency will become the target after a while. Applying clean production

principles to comply with sustainability principles in the food production line also signals that risks can be reduced to a certain level. However, if measures are not taken, factors that may adversely affect food production will appear. Greenhouse gases, ozone layer damage, poor air quality, drought, biodiversity, toxic chemicals, non-renewable materials, hazardous wastes, and polluted water are examples of these factors. Therefore, it is necessary to take counter measures to make the production sustainable. Waste reduction, pollution prevention, recycling, reuse of resources, and environmentally friendly design are emerging as measures that include clean production and green production principles for sustainable food production (Keijer et al. 2019; Chen 2008). They all need to be addressed in the context of sustainability, with the impacts outlined above being used as indicators for evaluation.

Green production is applied not only to production processes but also to products and services, as stated below:

- Green production-based processes (effective use of resources such as raw materials, water and energy, no polluting raw materials, reducing the amount and pollution rates of all waste during the production process)
- Product-based green production (reducing the negative impact of the product on the environment during its lifetime from raw material to its end use)

- Service-based green production (reducing the negative environmental impact of services provided throughout the product life cycle)

Green production aims to ensure that waste and greenhouse gases are reduced to the lowest level and the output (product) reaches the highest level by analyzing the material and energy flow within a certain system. In other words, it is based on the principle of using fewer natural resources and energy, and producing less waste for the same amount of production (Wang and Liu 2019).

However, more research needs to be done with regard to green production. The orientation of society toward environmentally-friendly products will enable an overall change in production and consumption philosophy. In today’s rapidly developing technological context, important pioneering studies are being done by companies to produce environmentally friendly green products in order to protect the environment. These will be the firms that survive into the new age, as the food business is forced into green production by forces from all sides.

Traditional Sustainable Methods in Food Production

Food has been processed since ancient times (Pilcher 2017). Traditional food production methods include sun drying, salting, smoking, freezing, canning, pickling, fermentation, etc. (Table 2). Almost all of these methods have been

Traditional and New Sustainable Production Methods in Food Industry, Table 2 Development of food production methods (Acharya et al. 2017)

Development of food production methods		
Traditional methods	New production methods	
	(circa 1900s)	(After 1960)
Canning	Extrusion	Freeze drying
Fermentation	Freezing and cooling	Infrared processing
Freezing	Pasteurization	Irradiation
Oven drying	Sterilization	Magnetic fields
Pickling	Ultra high temperature (UHT)	Microwave processing
Salting		Modified atmosphere packaging
Smoking (fumigation)		Ohmic heating
Sun drying		Pulsed power field
		Spray drying
		Ultrasonication

used to keep food safe for longer periods of time, with minimal nutritional losses (Sampels 2015). Sometimes, inappropriate food production methods may pose a risk of food loss, spoilage, and contamination of food products (Ishangulyyev et al. 2019). Therefore, the method to be used in food production should be suitable and sustainable to the characteristics of the food materials. At this point, traditional sustainable methods are also preferred for the production of some foods, because these methods contribute to the production of environmentally friendly products (Sozer et al. 2017). In addition, the traditional methods can be applied to processed and unprocessed foods depending on the usage area, frequency, and bioavailability of food products (Turck et al. 2016). Although almost all of the methods used in food processing (cutting, chopping, cooking, mixing, cooling, freezing, etc.) can be applied in the kitchen, sometimes, the production of these foods needs to be done in industrial scale instead of producing them in the kitchen. Therefore, the concept of food production does not have to be evaluated on an industrial scale (Horton 2017). Table 2 describes the chronological development of food production methods.

As indicated in the table, a traditional sustainable production method that can be applied to the same type of food can be replaced over time with the new production methods with a sustainable approach. The reasons for this situation may be the increase in the demand for food, the increase in the production speed with the new method, and the higher awareness of the new method on environmental protection. For example, the canning method can be preferred as one of the traditional methods for storing seasonal foods. In the following periods, ultrahigh temperature application can be used as a new method for storing this food. In this method, short-processing time is an important advantage compared to the first method used. In addition, since the energy required in this method is environmentally friendly, the method can be considered more environmentally friendly than it was originally. Freeze drying, which is used in later periods, can be preferred as a sustainable approach in order to be more sensitive for environmental protection and to reduce nutritional value losses of the food product.

New Sustainable Methods in Food Production

As a result of the acceleration of industrialization in food production, traditional food production methods started to be developed or to be replaced by new food production methods (Table 2). The new methods used in production should not be perceived as an advantage over the traditional production method, because in some cases, traditional production methods are the only option for some special foods. The methods used can be sustainable regardless of whether the method is traditional or new. For example, a type of food, whose raw material is specific to a particular geographical area, can be produced on a small scale, using a sustainable method that does not harm the environment. The important point here is that the technique used should be applied consciously. Otherwise, a number of potential risks for consumer health and for food safety may occur in contrary to the sustainable production principles (McElhatton and El Idrissi 2016). In relation to this, in an academic study involving six European countries, Tournier et al. (2007) found that new food production methods that improve the safety and nutritional quality of food and make the food product usable without compromising its characteristics are mostly accepted by consumers (Tournier et al. 2007). Similarly, studies examining the use of new food production methods instead of traditional food production methods highlight that the most successful transitions occur when sustainability principles can be followed for the development of new products and for the improvement of shelf life (Wallerstein 2016; Springer et al. 2018). Hence, if a transition from a traditional food production method to a new food production method is planned, the issues to be reviewed before and during production are indicated below (Di Giovine and Brulotte 2016; El Baz et al. 2016):

- Monitoring methods of traditional production
- Determination of production methods and differences in production
- Carrying out characterization studies of the products monitored at the production site

- Conducting controlled laboratory production while maintaining traditional production characteristics
- Standardization of the production method
- Ensuring the transition to industrial production based on the standardized laboratory production
- Production of the food material on an industrial scale and conducting shelf life studies of the produced foods by organizing appropriate storage conditions for food safety

Therefore, new food production methods can be considered as the sustainable approaches that use technological facilities to increase food production efficiency while maintaining the characteristics of food. Hence, harvesting higher amounts of food products per acre while conserving natural sources or producing the maximum amount of agricultural products to be raw materials for food production can be regarded as some of the goals of new food production methods.

Summary

The food industry is one of the basic building blocks of the worlds' economy, regardless of the geographical position of the country. Increasing awareness of sustainability in the world has led to new research among food businesses. One of these lines of enquiry is sustainable production. In this context, evaluation, analysis, and determination of future strategies are of great importance for sustainable production in the sector. The main purpose of these efforts is the transformation of traditional economic activities into modern ones, to facilitate efficient use of resources and an increase in production efficiency. The activities extend to the purchase of raw materials, their processing and conversion into high-quality food and beverage products, and finally delivery to the consumer. This can be done by using traditional food production methods or the new food production methods within the scope of sustainability. Hence, the focus of food production process should be on energy use, greenhouse gas emissions, resource and waste management, water and waste water management, and packaging.

Traditional food production methods may be preferable to ensure the stability of sensory characteristics of some specific local foods. It may not be easy to switch to modern production techniques for that type of food product because of the risk of deterioration in the consistency of those characteristic properties. On the other hand, new food production methods may provide advantages such as availability in mass production, short process time, ease of automation, etc. Both traditional and conventional methods guarantee the efficient use of raw materials and to convert these materials into high-quality and safe products using sustainable industrial processes. Hence, this entry highlights the importance of sustainability in food production, innovation, and green production within the scope of food production methods, being traditional methods and new methods. These are all important indicators when discussing sustainable development in the context of food production.

Definition

Transdisciplinary (TD) entails a mutual research and learning process involving researchers as well as nonacademic staff. TD research connects researchers, policy makers, and various other stakeholders (see ► [“Stakeholder”](#), ► [“Stakeholders”](#)) in a change process. In this process, the participants investigate and learn to understand issues and solve problems that extend many disciplines both theoretically and methodically (Roux et al. 2017). Consequently, the various perspectives merge in a co-creating learning process toward a wide-ranging aim. Various expertise and forms of knowledge unite to tackle challenging real-world problems in all their complexity (Arnold 2013; Gibbs and Beavis 2020). TD research is based on both theory and practice and is an alternative to more conventional disciplinary-based research. It is like an ideology and a way of dealing with, or taking care of, the world (Gibbs and Beavis 2020). The TD enterprise is a learning process “in which people recognize their own complexity, incoherence and potential to become” (Gibbs and Beavis 2020, p. 5). TD and sustainability are strongly related (see ► [“Sustainable Development,”](#) ► [“Sustainability Science”](#)), and TD research and education are increasingly advocated as routes toward sustainability (Hirsch Hadorn et al. 2006; Klein 2020). Knowledge regarding future development requires learning processes considering diversity,

complexity, and dynamic issues related to individuals as well as the society and nature on the entire planet. Therefore, TD is seen as a promising approach.

Introduction

Humanity faces terrific problems, because of threats to the basic life-supporting systems. These problems are complex and affect social and economic matters as well as ecosystems (see ► [“Sustainable Development”](#)). Climate change (see ► [“Climate Change”](#)) is one of the more obvious and disastrous of these dilemmas. Other tremendous problems are war, poverty, and inequality. These and similar enigmas interact and have a global expanse; the consequences are intergenerational, and unpredictable. Disciplinary knowledge alone cannot solve these challenges. The unsustainability quandaries call for creativity, transformation, and transcendence (see ► [“Sustainability Science”](#)). In turn, this calls for people able to view the world critically and deepen their own perspectives, but also to learn to see the world from other points of view, and to collaborate (see ► [“Collaborative Teamworking”](#)) in various contexts.

The disciplines produce amazing new knowledge (Kochher-Lindgren in Gibbs and Beavis 2020), and both truths and mistakes (Foucault 1981). Disciplinary-based knowledge is hegemonic, fragmented, insufficient, and ignores other forms of knowledge and truth, according to Gibbs and Beavis (2020; see also Foucault 1981). However, various rituals, certification systems, exclusion, and inclusion (see ► [“Inclusion”](#)) mechanisms robustly support the disciplinary division (Foucault 1981; Gibbs and Beavis 2020; Turner 2017).

On a personal level, the disciplinary lenses do not only influence how humans perceive the world but also what they neglect (Henriksen 2018). A disciplinary background may be a merit, and simultaneously act like blinds restricting the view, and reducing the creativity. “Creativity requires deep disciplinary knowledge—but at the same time it requires one to think broadly, across disciplines” (Henriksen 2018).

When experts from various fields collaborate, they recognize the limitations of their own perspectives (Cornell et al. 2013; Ivakhiv 2014) and realize that their actions influence other people and vice versa (Maguire in Gibbs and Beavis 2020). Consequently, the TD process starts inside the researchers themselves and their visioning of the world, when they access the interior respectively the exterior world (Nicolescu in Gibbs and Beavis 2020). Thus, the researchers become part of the knowledge creation in a larger sense, through reflections and discussions.

However, dialogues (see ► [“Dialogue”](#)) and sharing of thoughts are not problem-free undertakings. Knowledge production relates to norms that reproduce knowledge and both limit and facilitate communication (Turner 2017). Therefore, conflicts, power-struggles, and value-clashes are challenging (Gibbs and Beavis 2020; McGregor in Gibbs and Beavis 2020) (see ► [“Culture, Tourism, and Sustainability \(Cultural Heritage and Sustainable Tourism, Social Sustainability of Tourism, Socio-cultural Sustainability of Tourism\)”](#), and ► [“Value Creation”](#)).

The Emergence of TD

The disciplinary structure is well established with roots in the Middle Ages and even earlier (e.g., Gibbs and Beavis 2020; Foucault 1981), and have had a strong hold on education. However, facing reality and learning through disciplines is only one way of producing and structuring knowledge and science. There has also been a tendency to unite knowledge and research for hundreds of years (Hadorn et al. 2008; Hernández-Aguilar et al. 2020) and this has taken place in both Eastern and Western cultures. A holistic worldview is usual among indigenous people in the Global South, as well as in the Global North, and noticeable in religion, philosophy, and research, as well as in all levels of education (Wolff 2011). In the eighteenth century, the French encyclopedists searched for analogy, continuity, and interconnections distinguishing a broad network of social, political, and ethical concerns (see ► [“Ethics”](#), ► [“Ethical Dilemmas”](#), ► [“Ethics and Ethical Theories”](#))

influencing both artistic expressions and economic behavior (Wolff 2011). Since the late nineteenth century, opposite traditions of both general and divided knowledge have been present. Yet, efficient structures of both education and research are still necessary, which makes the disciplines powerful and their abandonment challenging.

There are many concepts similar to TD. Such concepts are the distinct words cross-disciplinary, multidisciplinary, and interdisciplinary, which often appear as synonyms (Hadorn et al. 2008; Niemi 2012). Cross-disciplinary is an umbrella word including multidisciplinary, interdisciplinary, and TD. The various methods by which cross-disciplinarity is implemented are also indistinct and difficult to grasp (O'Rourke 2017). Multidisciplinary research implies an approach in which various disciplines have little cross-fertilization, whereas interdisciplinary research is a coordinated collaboration involving researchers from several disciplines (Pohl and Hadorn 2008). The cross-disciplinary concepts have developed over time, and TD is regarded more advanced than interdisciplinary, which tendencies have been obvious since the nineteenth century (Klein and Frodeman 2017).

Besides other earlier ideas about uniting disciplines, interdisciplinary and TD thinking is based on systems science and systems thinking (see ► “Systems Thinking”). The systems thinking ideas date back in the 1940s, and as far back as in the Antique (Flood and Carson 2013). The so-called general systems theory aims at finding a science that stretches across disciplines, whereas systems thinking is a way to deal with complexity holistically.

The TD concept was coined at the *Organisation for Economic Cooperation and Development* (OECD) *International Conference on Interdisciplinary Research and Education* in Paris in 1970 (Gibbs and Beavis 2020; Mokiý 2019). The conference gathered leading researchers from many parts of the world. There were more than 200 presentations and the topics were innovative interdisciplinary approaches to epochal challenges. Three researchers in particular wanted to advance beyond the interdisciplinary view, and emphasized transcendence. They were the psychologist Jean Piaget,

the astrophysicist Erich Jantsch, and the mathematician Andre Lichnerowicz. Piaget and Jantsch wanted to anchor TD in central systems, structures, and patterns of thoughts, while Lichnerowicz saw mathematics as a universal science language (Gibbs and Beavis 2020).

The interest in TD research has grown and spread. Forums for TD are the *Network for Transdisciplinary Research* (td-net), the *International Center for Transdisciplinary Research* (CIRET), and the *Swiss Academic Society for Environmental Research and Ecology* (SAGUF). Conferences termed international, global (or something else) on TD have been held in a range of countries, and three so-called *World Congresses on Transdisciplinarity*.

The TD concept appears in numerous and distinct contexts related to science, health care, feminism, post-structuralism, cultural critique, and sustainability (Klein 2015, 2020). TD is a way of emphasizing equality between scientists, ideas, ideologies, and cultures (Mokiý 2019). “[T]ransdisciplinarity is a way of expanding the horizon of human and scientific worldview, allowing you to see and describe the world in all its diversity” (Mokiý 2019, p. 74, italic orig.).

Klein (2020) lists TD research issues including how human interact with natural systems, technical development, and topics related to values, politics, and culture. In addition, research highlighting unequal Global South/North dilemmas is increasing (e.g., Barth et al. 2019). However, even if TD has been a way to unite disciplines, it is increasingly divided in many differing branches with distinct aims, methods, and theoretical bases. Mokiý (2019) lists four such branches, of which what he calls *Transdisciplinarity-4* is recognized as its own scientific discipline or meta-discipline. TD is also gradually dividing into a research-focused and an education-focused direction, according to Mokiý.

The Interpretation of TD

There are many interpretations of TD, but two differing versions are most obvious (Gibbs and Beavis 2020). The first version has a theoretical and epistemological foundation, while the second

version is more pragmatic (McGregor in Gibbs and Beavis 2020).

According to the first version, the *Nicolescuian approach*, transdisciplinarity is a process that transcends the disciplinary limits. This approach was developed by the quantum physicist Basarab Nicolescu in the late 1970s (McGregor in Gibbs and Beavis 2020; Nicolescu in Gibbs and Beavis 2020), and further developed by Sue McGregor in the field of sustainability. This view states that “TD knowledge is complex, emergent, cross-fertilised, embodied and alive” (McGregor in Gibbs and Beavis 2020, p. 21).

The Nicolescuian TD approach employs phenomenology and searches for methodological and ontological answers on what knowledge or reality is (McGregor in Gibbs and Beavis 2020; Nicolescu 2014a, b). Nicolescu talks about multiple realities and calls the reality “plastic,” something that is simultaneously inside and outside a person. The *Hidden Third* or the *included middle* entails that there is a space or a level of reality between the subject and the object, the *logical axiom*. Since the subject, the object, and the Hidden Third interrelate, the human subject also appears between the Hidden Third and the world (Nicolescu 2014a). The Hidden Third escapes from analytical thinking and creates a bridge between two realities (Nicolescu in Gibbs and Beavis 2020). This space is alive and dynamic, and when people reach this “middle,” they can co-create new knowledge in a fusion of ideas in the in-between space (McGregor in Gibbs and Beavis 2020). Without the Middle Third as a part in knowledge creation, human is reduced to “cells, neurons, quarks and elementary particles,” according to Nicolescu (2014a).

The second TD version, the *Zürich approach*, is participative and applied. This approach was developed during a congress in Zürich in 2000, and denotes that knowledge is created through a synthesis of disciplinary as well as socially relevant knowledge. The TD research performs “the science differently,” the knowledge is thus “robust, reflective and accountable” (McGregor in Gibbs and Beavis 2020, p. 31). Among the researchers following this approach are Helga Nowotny, Michael Gibbons, and Julie Thompson

Klein. Gibbons started to call TD “socially robust knowledge” at the end of the 1990s, and many others use this epithet. According to Hadorn et al. (2008, p. 35), the aim and tasks of TD research are:

to grasp the complexity of the problems, to take into account the diversity of scientific and societal views of the problems, to link abstract and case specific knowledge, and to constitute knowledge with a focus on problem-solving for what is perceived to be the common good.

Brown and Lambert (2013) regard TD as a collective understanding of an issue including all valid knowledge, worldviews, and methods. In addition, it implies a potential to change. The TD research process consists of three stages: “problem identification,” “problem analysis,” and bringing results to fruition,” according to Pohl and Hadorn (2008). Thus, TD research denotes that knowledge is converted to action (cf. Hirsch Hadorn et al. 2006).

TD-Related Concepts

Many special concepts relate to TD. Among them are, first, the “trans-” words transdisciplinary and transdisciplinarity, which are wedded to several other trans-words, like the earlier described transcendence, but also transgression, transfer, transformation, translation, etc. Other common concepts in the TD discourse are the already mentioned “wicked problems,” “systems research,” “systems thinking” (Klein 2015), but also “life-world.” “Action research” (see ► “[Action Research](#)”), in which the researchers are themselves involved in what they study, is common in TD (e.g., Hadorn et al. 2008). In addition, TD has a complementary pair in “post-normal science.”

The word “trans” is an abbreviation of the Latin preposition “transitive” meaning across, over, or beyond (Harper 2021). According to Kochhar-Lindgren (in Gibbs and Beavis 2020, p. 32), “the ‘trans’ serves as an operator, a kind of shifter, between social systems and intellectual domains.” A concept used in art context is “indisciplinary,” meaning a “transgression” of

disciplinary boundaries, whereas interdisciplinary implies knowledge “transfer” from one discipline to another (Nicolescu 2014b). Many scholars relate TD to “transformation” and change (Hernández-Aguilar et al. 2020; Klein in Gibbs and Beavis 2020; see ► “Transformative Learning”).

“Translation” implies that academic expertise and research must be interpreted to be understood in other contexts (Klein 2020). TD requires skills of translation, and understanding of “how concepts, methods, and tools travel across domains” (Ivakhiv 2014, p. 12).

Today, TD has become a means to tackle so-called “wicked problems” claiming sound solutions (Gibbs and Beavis 2020). Rittel and Webber (1973) use the concept “wicked problems” as opposite to “tame problems” with a solution that can be tested. Oppositely, wicked problems have unintended consequences in an infinite time, and the consequences are impossible to trace. In addition, wicked problems cannot be resolved without changing the society that created them.

The German philosopher of science Jürgen Mittelstraß introduced the concept “lifeworld” (*Lebenswelt*) to TD research in 1992 (Hirsch Hadorn et al. 2006) with a distinctive meaning than in Edmund Husserl’s phenomenology and Alfred Schütz sociology (see, e.g., Leinsle 1992). Contemporary TD researchers mainly use the concept to denote the nonacademic everyday world (Klein 2015; Pohl and Hadorn 2008).

“Post-normal science” opposes science approaches searching for results through linear analysis, and thus it deals with value-related issues and uncertainty (Funtowicz and Ravetz 2008; Klein 2015). There are many additional concepts common in the TD discourse, and many book chapters and articles describe the TD vocabulary.

Transdisciplinarity as a Knowledge and Learning Approach

The TD approach builds on the idea that the world is diverse and changing. New forms of knowledge

emerge, cross boundaries and search for problem solving in collaboration with stakeholders. This process requires imagination, creativity, insight, vision, and originality (Brown and Lambert 2013).

Cornell et al. (2013) emphasize that future knowledge and learning have to accept that change takes place over temporal and spatial scales and involve a complexity of social-ecological interaction. Kochher-Lindgren (in Gibbs and Beavis 2020) describes TD as situated knowledge dependent on time, place, aim, and various other circumstances. Therefore, the methods also shift dependent on the situation. The TD researcher needs to develop skills and networks, and what Cornell et al. (2013) call “T-shaped skills.” These skills imply deep disciplinary knowledge combined with skills to interact with a wide range of experts both from inside and outside the academia. Yet, if TD aims at a transcendent, it is about more than accessible skills, and the learning process goes beyond the measuring ideology.

Nicolescu (1999) means that contemporary education is based on worn-out values, and not at all in line with what the world needs. He uses UNESCO’s four pillars of learning from the 1970s: “learning to know,” “learning to do,” “learning to live together (with),” and “learning to be” as a basis in TD learning. When it comes to “learning to know,” he stresses both quality of the content and flexibility, and requests education that encourages the students to question facts, representations, and rationales. In addition, he sees the role of learning to encourage bridge building between disciplines, and between disciplines and personal meaning making. “Learning to do,” he sees as fostering a person, who has a flexible, interior core, and easily can change occupation. This surprisingly corresponds with the flexible lifelong learner that European policy emphasizes (Biesta 2006; Jeronen et al. 2009; Wolff 2008). Yet, learning to do also implies creativity and discovering novelty, according to Nicolescu. On the other hand, with “learning to live together [with],” Nicolescu denotes developing a transcultural, transreligious, transpolitical, and transnational attitude. Finally, with “learning to be” he denotes discovering one’s own conditioning, and relation to others.

According to Nicolescu (1999), who asks for education that recognizes the sensitivity of the body, and not only the intellect, “[a] viable education can only be an integral education of the human being” (p. 1). Therefore, he sees TD as an educational approach that reveals the role of intuition, imagination, sensitivity, and embodiment (cf. ► “Phenomenon-based Learning”). He asks for a new tolerance based on the TD attitude, and a new form of university education, a TD “evolution,” which starts from the teaching of teachers. The word “university” in fact originates in the word “universitas” meaning “whole” (Pohl and Hadorn 2008). Nicolescu defines the new TD knowledge production and learning as an opening toward society and all places outside the university, where learning takes place; toward cyber-space-time; toward universality; and most important, “towards a redefinition of values governing the existence of learning itself” (Nicolescu 1999, p. 10).

Nicolescu’s learning ideas might seem old, and there are an increasing number of articles reporting outcomes from more recent TD learning projects, but profound theory development has hitherto been mostly absent. Even if TD approaches also appear outside academia, like in school contexts, the theoretical ground is still vague. However, TD learning has common features with transformative learning, and the development of these two approaches could potentially be combined.

TD Learning and Sustainability

Many scholars see TD as central in the context of learning related to sustainability (e.g., Barth et al. 2019; Chilisa 2017; Klein 2015), and highlight TD when discussing how to implement sustainability. This is visible in several international policy documents published by UNESCO, the OECD, and the EU, not least in the Sustainable Development Goals (SDGs) (Zinchenko et al. 2021; see ► “Sustainable Development Goals (SDGs)”, and ► “Sustainability Education and Environmental Awareness”). Education for global

environmental change requires that people from an early age receive experiences of how to engage in complex and socially significant topics (Cornell et al. 2013). Such education includes theory and methods at the academic level, negotiation and communication skills, as well experience of knowledge unification. A report from a regional UNESCO symposium on sustainability science in Malaysia, reads:

The explanations on the mono-, multi-, inter- and trans- research should combine the non-academic circles. An approach to knowledge production has to be beyond discipline, problem solving, process-oriented co-creation and participatory approach and focused on six sets of questions: complexity, consequences, interpretation, change, decision-making and responsibility. (UNESCO 2016, p. 3)

Likewise, sustainability is emphasized in various TD contexts, such as in the advertisement of *III World Congress of Transdisciplinary* in Mexico in 2020 (UNESCO 2020). At that congress, the main topics were planetary education, transhumanism, artificial intelligence, destructive technologies, health, poverty, destruction of biologic diversity, climate change, and war.

The concept of learning includes both individual and social dimensions. According to Cornell et al. (2013), sustainability “as an open-ended process of social learning in which a new balance is continually being sought between multiple social, economic and environmental challenges and goals” (p. 62). Barth et al. (2019) distinguish social learning between “learning in a group,” “learning as a group,” and “learning as social change.” The last process is the one that transcends the group boundaries. These authors also make a division in three other forms of social learning that may happen in all these three earlier mentioned areas. They are the forms introduced by Argyris and Schön in 1996; “single-loop,” “double-loop” and “triple-loop learning,” of which triple-loop learning is a reflection that goes beyond “reflection on how to do things differently towards how to do different things” (p. 383). Barth et al. (2019) consider that triple-loop learning comes close to TD as a research practice. Medema et al. (2014) see “multi-loop social learning” as crucial for learning related

to sustainable decision-making and to effectively engage the participators in collaborative learning.

Summary

To introduce TD is not to abandon the disciplines; both disciplines and TD are needed. Ivakhiv (2014) sees disciplinarity and TD as two faces, one looking inwards and the other outwards. TD is “not a luxury, it’s not just intellectual play, and it is a necessity if we want to face the complexity of our world” (Nicolescu in Gibbs and Beavis 2020, p. 63). In line with Nicolescu (1999), Klein (2009) sees TD as a knowledge and learning approach. She (p. 36) argues that “a new ‘transdisciplinary attitude’ is needed, capable of sensitizing all social actors to more comprehensive, inclusive methods of knowing and acting in the world.” Chilisa (2017) questions how African philosophies and worldviews could inform methodologies and promote decolonization and indigenization of sustainability science and TD research.

The unequal power relations between indigenous and western academic knowledge are the greatest threat to any form of collaborative research that seek[s] to address Africa’s sustainability challenges. In fact, the collaboration whether coming from mono-disciplinary, interdisciplinary or transdisciplinary research, sometimes borders on a form of colonisation of ILK [indigenous and local knowledge]. There is need to decolonise mainstream methodologies that inform sustainability science inquiry, reclaim indigenous epistemologies, and envision indigenous methodologies that promote the co-existence of knowledge systems. (Chilisa 2017, p. 813)

Kessi et al. (2021) state that it is high time to decolonize academia and orient education toward the future. This outlook applies to transformative learning, but also TD learning.

Sustainability is an aim, and as such, is utopian (Wolff 2008; Wolff and Ehrström 2020), but utopias are better guiding principles for research and learning than dystopias. Dystopias easily lead to an avoidance of risks, but strong utopias can lead education toward transformation, especially open-ended utopias (Harris 2014). Transformation

demands a total renewal of educational theory, policy, practice, management, in addition to an entire reorganization of educational institutions. This change could start from a thorough TD learning process that includes collaboration on many institutional levels, among researchers and other staff members, students, and numerous stakeholders (Wolff 2007; Wolff and Ehrström 2020). It is a continuous change and learning process toward a better future “accepting the dynamic between the parts and the whole, stable and chaotic systems, individuals and groups, and creative and rational thinking” (Harris 2014, p. 215). This process also includes reflection on humans as a part of the non-human world, and as more or less powerful performers, for better or worse, transforming the entire planet.

Nicolescu (2014b) challenges the sustainable development idea when he rejects what he calls a “reductionist and binary thinking” reducing everything to society, economy, and environment. He means that this thinking ignores both the individual and the cosmic level of reality. Therefore, he asks for “a united theory of levels of reality,” since merely scientific knowledge will lead to self-destruction of the human species. He calls it a “New Renaissance,” and a new spirituality free of dogmas (Nicolescu 2014a). Yet, aiming at a transcultural, tranreligious, and transpolitical TD (Nicolescu 1999) might not be enough anymore. The planetary situation begs for a transformed awareness and understanding of a reality including not only other humans but also other species (biotic factors), and abiotic factors (such as water, soil, and air).

Definition

Transformative learning (TL) is a concept that has been popular in adult learning contexts for many decades and lately also in sustainable development and sustainability education contexts (see ▶ [“Sustainable Development”](#); ▶ [“Education for Sustainable Development”](#)). By the end of the 1970s, the American sociologist Jack Mezirow (1923–2014) started to develop what he called the “transformative learning theory” especially with adults as the target. According to Mezirow (2009) learning is a process in which the learners transform problematic frames of reference, such as democracy, justice (see ▶ [“Social Justice”](#)), and even love (see ▶ [“Ethic of Love”](#)). The aim of TL is to make these frames reflective, and open for change. As a communicative learning theory, TL sees the adult learners as active participants in discourses (Mezirow 1991). Mezirow continued to alter and develop his theory throughout his life. He has collaborated with many other educational researchers with different views on TL, and his ideas have been widely modified and developed to suit various new contexts (see, e.g., Mezirow et al. 2009). As a reconstructive theory, TL strives to shape an idealized model of the adult learning process (Mezirow 2009). Especially when implemented in sustainability education, TL is similar to reconstructive social theory, which is aimed at encouraging practical social change (cf. Vandenberghe 2018).

Introduction

Transformative learning (TL) is a major adult learning approach (Mezirow 2009a; Taylor 2007). The TL theory has unquestionably changed the view of adult learning during the last few decades. Jack Mezirow developed TL particularly for adult learners and did not recommend it for younger targets. The theory is strongly based on understanding of how adults learn and develop. TL can take place in formal adult learning settings, but also in other adult learning

situations (Mezirow 1990). It is usual in higher education, organizational development, professional training, and many more contexts. The limits between education, learning, and research are diffuse in TL, likewise the limits between educators and learners. Since action research (see ► “Action Research”) is common in relation to TL (Taylor 2007), both the educators and the learners also easily become researchers (Mezirow 1990).

Initially Mezirow was inspired by the American women’s liberation movement and his own wife’s adult learning experiences (see Mezirow 1991, 2008). In addition, several scholars who were influential in education stirred his ideas. Among them were the Austrian-British philosopher Karl Popper, the Brazilian educator Paulo Freire, the American psychiatrist Roger Gould, the German philosopher Jürgen Habermas, the American philosophers John Dewey and Thomas Kuhn, and many others (see Kitchenham 2008; Mezirow 1990, 1991, 2009b).

Mezirow (1991) saw Popper as a forerunner of the TL theory. Popper regarded learning more as a way to change the structures of one’s expectations than to cover knowledge gaps. Freire’s ideas, especially as he expresses them in *Pedagogy of the Oppressed* (1970) and *Education for Critical Consciousness* (1974) is another foundation of TL. According to Freire (1970, 1974), adults need to problematize their actual historical situation. The pedagogy has to awake critical awareness among the students and empower them to become active transformers of their own reality. Gould’s research includes adult development and TL in relation to trauma (Gould 1990; Mezirow 1991, 2009b). Mezirow drew from Gould when claiming that TL could be the result of someone gaining insight into unresolved traumatic experiences (Mezirow 2009b). Habermas’ theory of communicative action, discourse ethics (see ► “Discourse Ethics”), and knowledge interests are also apparent in Mezirow’s TL theory. In the book *Knowledge and Human Interest* (1968), Habermas introduces three cognitive interests: technical, practical, and emancipatory. Meaning is established through consensus based on the actors’ self-understanding; the emancipatory

cognitive interest is formed by self-reflection. Mezirow was also influenced by the critical theory, of which Habermas was a part. Likewise, there are similar elements in Bildung theories and in TL, which also relate to Habermas (see Buttigieg and Calleja 2021; Sørensen 2015 and ► “Phenomenon-Based Learning”).

Inspired by Dewey, Mezirow (1991) saw meaning perspectives as selective codes directing perception and understanding. Simultaneously, Mezirow claimed that he used “perspective transformation” similarly to how Kuhn used “paradigm shift” indicating changed scientific views in his book *The Structure of Scientific Revolutions* (1962). However, even if the many influencers’ views are visible in Mezirow’s TL theory, his thoughts have changed and advanced over time. To read more, Baumgartner (2012) gives a comprehensive review of how Mezirow’s theories have developed.

The TL theory has met a lot of criticism; it has been tested, evaluated, revised, and adapted to suit various contexts. Nevertheless, it is still vital (Kitchenham 2008). Conferences on TL attract large audiences, and scholars continue writing dissertations, articles, and books on the TL topic.

The *Journal of Transformative Education*, founded 2003, is one of the main publication channels. TL is especially popular in the field of sustainability education practice and research. Edmund O’Sullivan’s book, *Transformative Learning: Educational Vision for the 21st century*, published in 1999, inspired many sustainability education scholars to try to implement and develop TL in their field of interest. In addition, *transformation* has become a central aim in both sustainability and educational policies in the twenty-first century.

In the UNESCO document *Education for Sustainable Development Goals: Learning Objectives* (2017), transformation and transformative pedagogy are fundamental (see also Leicht et al. 2018; ► “United Nations Agenda 2030 on Sustainable Development Goals, The”; ► “United Nations Sustainable Development Goals 2030, The”; ► “Sustainable Development Goals (SDGs)”). The UNESCO document calls for “an action-oriented, transformative pedagogy, which

supports self-directed learning, participation and collaboration, problem-orientation, inter- and transdisciplinarity [see ► [“Transdisciplinary Learning”](#)] and the linking of formal and informal learning” (UNESCO 2017, p.2). In this pedagogy, the educator’s role is to empower the learners to change their worldviews. UNESCO (2014) also calls for whole-institution approaches, in which entire schools or other educational institutions, and also private and public organizations, are transformed at all their collective levels. However, what transformative pedagogy really is remains undisclosed in this document.

The Theory’s Basic Elements

In the TL process, individuals learn to reflect on experiences and preconceptions, hidden values (see ► [Value](#)), and assumptions, to think critically, and to participate freely in rational discourses (Mezirow 1990, 1991). One aim of TL is to encourage learners to deliberate on earlier assumptions, and to come to a position in which they may change viewpoints and start acting in alternative ways. Valued-laden issues and activities may especially generate critical reflection, and even change, when old presuppositions are detected (Mezirow 1991; Taylor 2009).

TL is a process of meaning making and alteration of viewpoints according to new insights. Meaning making is to interpret and make sense of experiences and thus meaning making becomes learning, and even altered actions (Mezirow 1990, 1991). Simultaneously, learning and thinking are overlapping. In TL, actions not only entail behavior, but rather “praxis” or “creative implementation of a purpose” (Mezirow 1991, p. 12). In addition, the meaning making process can be both paralinguistic and linguistic.

Meaning making has two dimensions, “meaning perspectives” and “meaning schemes,” both controlling what we learn, according to Mezirow (1990, 1991). Thus, meaning *perspectives* (or frames of reference) are established during the socialization process in childhood. The meaning perspectives describe the fundamental ideas that an individual rely on when interpreting new

experiences. They are higher-order schemata, theories, beliefs, basic assumptions, rules, language, and networks of arguments that make earlier experiences assimilate and transform new experiences (Mezirow 1991, 2009b). One could call them the glasses through which an individual views the world.

At a more practical level, meaning *schemes* organize the way individuals react on new experiences; they are rules for interpretation (if this happens, you shall do this). Meaning schemes come from earlier, often unreflective interpretations (Mezirow 1991). They guide the way an individual feels, understands, judges, and acts upon something. Accordingly, they tell an individual how to do something, and how to understand oneself and others, but also the opposite, what not to react to. If meaning perspectives metaphorically are glasses that gives a specific picture of the world, meaning schemes are shoes that regulate what roads it is comfortable to walk on in relation to the picture the glasses show.

TL offers new meaning perspectives and encourages new meaning schemes that challenge the old ones. Since TL has three related core elements, individual experience, dialogue (see ► [Dialogue](#)), and critical reflection (Taylor 2009), the basic when implementing TL is to facilitate learning through powerful individual experiences that promote critical reflection and dialogue. Following Habermas, TL makes the distinction between instrumental and communicative learning (Mezirow 2003). Instrumental learning refers to learning to control and manipulate the environment, improving predictions and performance, whereas communicative learning entails that an individual understand what another participant in a dialogue means. It includes awareness of the others’ assumptions and intentions.

Reflection, and especially critical self-reflection, is a basic element in TL. Reflection is a higher-order mental process guiding actions, giving coherence to the unfamiliar, and reconsidering the justification of what is already known (Mezirow 1990). When reflecting, the learners think about themselves, others, and society (Dirkx and Smith 2009). Thus, reflection includes “making inferences, generalizations,

analogies, discriminations, and evaluations, as well as feeling, remembering, and solving problems” (Mezirow 1990, p. 5). Both meaning perspectives and meaning schemes may be transformed through reflection. Using the earlier metaphors, reflection is a way to stop or slow down, take off the glasses and even the shoes, or change into more appropriate ones, and ponder anew about which route to take.

When Mezirow uses the concept “critical reflection,” he means reflection on presuppositions in prior learning, which, in turn, means challenging the validity of established meaning perspectives and habitual expectations (Mezirow 1991). “Critical self-reflection” is a major learning experience, which leads to a reassessment of one’s own knowing, believing, feeling, and acting (Mezirow 1990).

Reflections may take place at three levels and involve consideration about the learning content and process, as well as its premises (Taylor 2009). Reflection on premises is the basis for the other levels. In its furthest extension, the reflection may even lead to a change of worldviews. Yet, such a significant change may awaken strong emotions (Taylor 2009; Sterling 2011).

In a social learning situation, the experiences and collective activities of all the participating learners may inspire critical reflection and discussions. Value-laden learning content as well as intense and emotional experimental activities can encourage critical reflection and dialogue (Taylor 2009). Dialogues in a trustful atmosphere promote both critical reflection and transformation. According to Edward W. Taylor (2009), critical reflection develops the learners’ awareness of power relations and agency to transform both their own reality and society.

The Role of the Educator

Every adult educator or teacher has a responsibility to foster TL and encourage the students to critical self-reflection and action taking, according to Mezirow (1990). Since adults have a variety of meaning perspectives, the educator’s task is to recognize the learners’ points of departure and to

acknowledge the diversity of viewpoints. Mezirow (1990) sees the educator as an “emphatic provocateur” and a role model for critical reflection, but also a critical co-learner and re-learner in the emancipatory TL process. Heaton (2020) calls the educator “a cultural activist,” who fosters social, economic, and political conditions and thus enables participation, and critical reflection. Even if the relationship between the educator and the students is based on policy and organizational structures, flexibility allows the educator to become the learner and the learner educator (Mandell and Herman 2009). When learners transform, so do the educators (see also King and Heuer 2009). Therefore, the educators are those who foster leadership in others instead of acting as strong leaders themselves. The educator’s role is to help the students bring forward their ideas in learning situations (Taylor and Jarecke 2009). Subsequently, the student voices influence the larger educational structures and initiate a change toward a TL culture (see Mandell and Herman 2009).

An authentic practice is a foundation for a trustful relationship between educators and learners (Taylor 2009). Trust is important if the educator wants to promote critical reflection. Since TL can awaken strong emotions and feelings of vulnerability, the educator needs to be responsive and aware of the students’ comfort levels (King and Heuer 2009; Tisdell and Tolliver 2009). Mezirow (1991) claims that remembering relates to emotions, and the strength of the emotion and its frequency affect how well one remembers something. Since an emotional stress may lead to a transformation of a meaning perspective, stress cannot be totally avoided (see also Sterling 2011).

Theory Development and Research on Transformative Learning

Numerous scholars have developed TL, either with Mezirow, or without him. Therefore, the ideas originating in Mezirow’s TL theory has expanded in many directions by focusing on various aspects of the basic theory or emphasizing

new elements. The theory has even been fragmented (Cranton and Roy 2003). From Mezirow's more cognitive approach, TL now focuses on holistic, extra rational and integrative perspectives (Merriam and Bierema 2013), as well as embodied and intuitive knowledge, and individuals in social relations (Lange 2009). The perspective has turned toward depth psychology, humanism, post-structuralism, as well as to post-humanism (Cranton and Roy 2003). Researchers have discussed if TL is rational or extra-rational; imaginative, cognitive, or emotional; or if it is individual or social (Cranton and Roy 2003).

Many studies have affirmed the TL theory and have described how it has been implemented in various contexts and with various aims. Edward W. Taylor (2007) describes how the focus has shifted from *identifying* transformative experiences to finding *elements* that shape the transformative experiences, and how to foster TL. Based on a TL review, he asks for more critical views on the presence of critical reflection in the learning processes. He also requests distinguishing between various forms of reflection. In addition, he wants a better awareness of the students' attitudes, personalities, and roles (cf. Aboytes and Barth 2020).

Kovan and Dirkx (2003) regard Mezirow's TL approach as too cognitive and rational; they emphasize the role of emotions, spirituality, and imagination in a broader sociocultural learning context (see also Taylor 2009). Referring to Carl Jung's psychology and his *individuation* concept, they compare the TL process with a journey in which the individuals recognize the self in relation to the rest of the world and becomes who they truly are. Kovan and Dirkx are also inspired by Boyd's TL (see e.g., Boyd 2008). Dirkx seeks a more holistic understanding of subjectivity combining intellectual, emotional, moral, and spiritual dimensions of an individual's being in the world in a linking of experiences from an individual's outer world with the inner world (see Dirkx et al. 2006). Napan et al. (2020) give an example of how TL is implemented in a Māori context acknowledging cultural typical learning elements, for example, collaboration, partnership, and non-cognitive learning approaches like dance, poems, and music. The following section presents a few

examples on the many TL directions that touches sustainability.

Sustainable Directions of Transformative Learning

There are various views, implementation methods, and interpretations of TL in relation to sustainability. Unfortunately, TL has been used in sustainability education research more or less rigorously. In a large review of research articles on TL in sustainability education, Aboytes and Barth (2020) found that even if TL is a popular theory in this research field, it is often implemented without any critical theoretical examination, but increasingly used as a buzzword (Aboytes and Barth 2020). In both UNESCO's educational policy and in sustainability education research, the request for TL is often combined with the idea that education has to promote sustainable *core* (or *key*) *competencies* (e.g., Leicht et al. 2018). Lange (2019), on the other hand, does not believe in a focus on competencies, since she thinks sustainability demands a TL approach that is a shift from modernist assumptions of outcomes, measurements, managerialism, and colonization. She asks for decolonization and a deep transformation into new ways of thinking and acting within the mutual circles of humans and nonhumans (Lange 2018, 2019). In addition, she calls for interdisciplinary and transdisciplinary research (see also Gunnlaugson 2005), and a development of higher education to play a significant role in social change fostering awareness, learning, and action (see also Wolff 2007).

Lotz-Sisitka et al. (2015) picture the practical TL as transdisciplinary. They argue that it is high time to abandon unsustainable systems and "to strengthen transgressive learning and disruptive capacity-building" involving multiple and multi-voiced actors decolonizing thinking and coproducing knowledge (p. 73). Similarly, Gautam (2021) wants the students he teaches to become revolutionary agents and magicians criticizing and transforming the human condition. Lange (2009, p. 195) describes TL as progressive and gradually advancing, meaning "that people will transcend self-interest to embrace larger

social interests.” Consequently, she believes that it is possible to create a transformative space in which participants can individually and jointly transform the world. This happens when they understand the purpose of work, the mechanism behind global economy, and start to respect the natural world. Thus, they are encouraged to develop principles and action plans to guide their own work and living as a part of a larger “web of life.” Likewise, O’Sullivan (2008) asks for a TL vision viewing the human species embedded in the “web of life” and suggests a transformation to an “Ecozoic” mode of being.

Lange (2009) emphasizes that TL is about reconstructing worldviews, and O’Sullivan (2012) calls for a planetary worldview. Lange positions the dialectic pedagogy she calls for between critique and hope. To encourage the learners’ hope and a deeper connection with nature, she employs nature experiences. Also, Kovan and Dirkx (2003) believe in nature contemplations as a method to trigger TL. Inspired by Karen Barad and post-humanistic ideas, Lange (2018, 2019) claims that transformative sustainability education asks for a transformation that is both ontological and epistemological. She argues that educators and learners are intertwined in many levels of life and engagement (from their own bodies to the entire cosmos). What she calls an “ethico-onto-epistemological transformation process” could lead toward socially just and ecological regenerative societies, according to her (Lange 2018, p. 298).

To make sure that TL happens, there are researchers who have started to use a practice-based design process called *WeValue InSitu* to measure the success of TL in sustainability education contexts (Harder et al. 2021; Odii et al. 2021). This process was originally developed to produce indicators for shared values in civil society groups. To use a structural design to test TL sounds remarkable, but the future may tell how good an idea this is.

Diverse Critical Comments

The TL theory is hard to implement, the process difficult to understand and predict, and the

outcome difficult to evaluate. It is a contradictive learning approach, and much of it remains unclear (Taylor 2009). Based on diverse theories, the TL theory is utopic. It is even called illusive (Taylor 2009) and a beautiful metaphor (Howie and Bagnall 2013). A central foundation of TL is Habermas’ thoughts about communicative action and consensus building through rational public discussions, which is more an ideal than a practical means. As an ambiguous and unsettled learning approach, it is not yet properly understood (Taylor 2009). Likewise, TL is difficult to implement in various educational settings. The TL theory has also been criticized because of its theoretical unboundedness, for being an inadequate theory of learning, its lack of critical assessment, and lack of predictiveness, as well as its nonquantifiability, the failure to validate it, and its problematic example cases (Howie and Bagnall 2013).

In addition, authors have blamed TL for representing a Western view neglecting other perspectives (Gilpin-Jackson 2014; Cranton and Taylor 2012; O’Sullivan 2012) and encouraged including indigenous knowledge and worldviews in TL (Burns 2015). In the book *Research as Transformative Learning for Sustainable Futures: Global Voices and Visions*, edited by Taylor and Luitel (2019), the chapters written by authors from Asian, South Pacific, Middle Eastern, and African countries are more broadly critical of the hegemony of a neocolonial Western worldview and positivist epistemologies.

Sterling (2011) rightly emphasizes that Mezirow did not create TL for a total rebuilding of the world. To adapt a theory for transforming the entire world demands thoughtful consideration, even if it initially was designed to help people overcome traumatic experiences or change life tracks. Another problem is that TL often serves as a normative tool in sustainability education. To create models aiming at changing the individuals might be tempting, but also dubious (Wolff 2011). If transformation of individuals is the appropriate aspiration, educators must accept the risks of going forth into the unknown. A critical and reflective practice may generate a change of values among the educators and students involved, but the will to

change has to advance from within the individuals. Therefore, the outcome of changed meaning perspectives is not foreseeable (Wolff 2011).

Summary

TL is a powerful learning approach with potential “to evoke a kind of deep learning that engages learners in a process of self-work, self-change, and transformation” (Dirkx and Smith 2009, p. 64). Even if TL is steadily developing, it is a complex approach with many unidentified features (Dirkx and Smith 2009; Taylor and Jarecke 2009). TL can employ a variety of methods and take place in many contexts, but to evaluate the results is not easy (e.g., Taylor 2009). The increasing use of online learning contexts is also a growing challenge (Dirkx and Smith 2009).

TL has been regarded as an answer on how to transform society in a more sustainable direction. Yet, TL can either be forced (Cranton 2009) or rushed (Taylor 2009). The educators can plan and arrange learning situations to empower the students’ learning in a transformative way, but never be sure that the projects will succeed. As Cranton argues, success depends on the students, the context, the resources available, and many other circumstances. The TL theory is often handled superficially without direction, not least in sustainability education (Aboytes and Barth 2020), even if the theoretical basis is most important in TL (Taylor 2009). The move from knowing and understanding to social action is not easy (Cranton 2009; Wolff 2011; see also ► “Agency Theory”). Therefore, it is not self-evident that an educational approach will transform neither individuals nor society toward sustainability (see ► “Sustainability Education and Environmental Awareness”). Nonetheless, TL is still seen as a promising approach in adult learning (Taylor 2007), and in sustainability education (Lange 2019). In an obviously unsustainable time, with huge dilemmas like climate change (see ► “Climate Change”) and a long-lasting pandemic, there is an urgent need for appropriate learning theories. In that situation, TL is better than many other theories developed to meet various challenges.

Conversely, in contemporary times, TL without any focus on sustainability might be worthless. Policy documents on the twenty-first-century skills highlight TL. Yet, Bell (2016) argues that if the policy does not focus on sustainability and a transformation of the global economy, the learners will not have the skills and responsibility (see ► Responsibility) they need to live a sustainable life on this planet (see also Sterling 2011; Zilliacus and Wolff 2021; Wolff et al. 2020). According to Heaton (2020), the problem is not *what* humans today know, but *how* they know it. Yet, Sterling was already skeptical in 2011 (p. 27), as he stated that TL is difficult and that “the mainstream emphasis on cognitive learning, with a little ‘values education’ thrown in, is simply insufficient to meet this challenge” [the unsustainability challenge]. TL is definitely a complicated theory, and to fulfill the demands of sustainability education it has to be developed, tried out, and evaluated meticulously. Yet, like Bildung it might even be impossible to assess (see Buttigieg and Calleja 2021), and it is definitely not a quick fix.

Definition

Sustainability transitions are long-term, multi-dimensional, and fundamental transformation processes through which established societal systems shift to more sustainable modes of production and consumption. Examples of ongoing

sustainability transitions can be found in the food, energy, mobility, and construction sectors, among others. As large-scale societal change processes, sustainability transitions are characterized not only by technological advances and industrial transformation but also by wider social, behavioral, and regulatory change. This is also why sustainability transitions are often referred to as a type of ‘socio-technical transition’ or ‘system innovation’. Sustainability transitions depend on the co-evolution of economic, technical, and social system elements and unfold over time horizons that can easily span decades. Research on different aspects of sustainability transitions has been conducted from a variety of domains, ranging from environmental sciences over business studies to political sciences. The relatively young and rapidly growing research community focused on *transition research* explicitly focuses on the dynamics by which a socio-technical system can transit toward greater sustainability.

Introduction

Sustainability has widely been recognized as one of the grand challenges of the twenty-first century. Both scholars and policy makers stress the need for the *Great Transition* (Raskin et al. 2002) or the *Great Transformation* (WBGU 2011). With these terms they refer to achieving greater sustainability and “fundamental changes in the way societies produce and consume” (United Nations 2002, p. 7). Because current patterns of consumption and production are deeply embedded in societal structures and lifestyles, their transformation requires wide-ranging changes to consumption practices, technologies, infrastructures, and institutions at regional, national, and global levels. The long-term, multidimensional, and fundamental transformation processes through which established societal systems shift to more sustainable modes of production and consumption are referred to as *sustainability transitions* (Markard et al. 2012, p. 956).

The term sustainability transition is not used in a uniform manner. In the broadest sense, a transition (lat. “transitio” = crossing over) refers to

“going from one state or phase to another.” Commonly, the term sustainability transition can thus be used to refer to any change process that indicates the transformation of a system or entity to a more sustainable state. More narrowly, however, researchers have used the term sustainability transition to refer to the transformation of systems that fulfill a societal function such as transport, energy provision, or housing (Elzen et al. 2004; Elzen and Wieczorek 2005).

Research on sustainability transitions has most prominently been conducted by the research field known as *transition research*, which combines insights from science and technology studies, evolutionary economics, and sociology as well as innovation studies (Geels 2010). Whereas transition research generally deals with long-term changes in socio-technical systems and has also investigated historical transitions such as those from horse carriages to trains or sailing to steamships, the explanations and models the research field offers have received most attention in connection to sustainable development (Geels 2010; Markard et al. 2012; Smith et al. 2010). Prominent examples of empirical areas that transition researchers study are sectors such as energy, transport, food, water, and waste.

The roots of transition research lie in the Netherlands, where the topic was given a central place in the National Environmental Policy Plan (Elzen et al. 2004) and has been driven forward by a very active scholarly community since the early 2000s. As of 2020, the Sustainability Transitions Research Network (STRN) counts more than 2000 members. The community publishes a journal dedicated to the field (Environmental Innovation and Societal Transitions) and organizes the annual International Sustainability Transitions Conference (IST).

Defining Characteristics of Transitions

What unites different streams and models within transition research (for an overview see Markard et al. 2012) is the understanding that technology alone is insufficient to accomplish societal change. Transition research is anchored in the understanding that technology can only provide

a function to society when embedded in a *socio-technical system*. A socio-technical system includes actors such as users, producers, suppliers, public authorities, or financiers as well as the respective infrastructures, patterns of behavior, cultural values, and policies that guide their interaction (Elzen et al. 2004; Geels 2002; Kemp et al. 1998). A classic example for a socio-technical system is car-based transportation, where the actual technology (the car) only provides the function of mobility to society in interaction with the road-based infrastructure, gas stations, traffic rules, parking systems, repair shops, or driving behavior, among others (Geels 2005). A *socio-technical transition* then describes the shift from one socio-technical system to another. Such a shift requires the co-evolution of multiple changes in the spheres of production, distribution, consumption, and ways of life (Elzen et al. 2004). For example, novel technologies such as hydrogen cars require a different fueling infrastructure, changes in driving behavior and safety rules, and the refurbishment of car production facilities, among others (Tukker 2008). Sustainability transitions must therefore be understood as multi-change processes (technical, economic, behavioral) that unfold simultaneously and interact at different levels (regional, national, global).

Defining Characteristics of Sustainability Transitions

In comparison with other processes of long-term societal change, sustainability transitions are said to have three special characteristics (Geels 2011, p. 25), namely:

1. Sustainability transitions are goal-oriented or purposive toward a collective good (sustainability), yet this normative direction is often highly contested.
2. Sustainability transitions require policy support because more sustainable solutions initially score lower on price/performance dimensions than established technologies.
3. Sustainability transitions require the strategic reorientation of incumbents because domains

such as energy or transport, where sustainability transitions are needed the most, are dominated by large firms in control of complementary assets and infrastructures.

For business scholars, it is also important to keep in mind that the models and frameworks commonly used in transition research depart in different assumptions than those used in management and innovation research (Geels 2018): First, transition research takes a holistic and systemic perspective. It is less interested in single innovations or products but rather focuses on the interaction between such different system elements. Second, transition research cares less about price/performance competition in markets but pays explicit attention to social, political, cultural, and infrastructural dimensions (taxes, subsidies, performance standards, regulations) as drivers of change. Third, transition research is not compatible with a “point source” understanding of change, in which disruption can be caused by single actors, but tries to understand the shifts that may occur when new technologies align with broader ongoing processes of change such as political struggles or societal debates. Business and management scholars should therefore remember that the single firm is only considered as one of the many actors who need to cooperate if we are to accomplish sustainability transitions.

Summary

Sustainability transitions are defined as long-term, multidimensional, and fundamental transformation processes through which established societal systems become more sustainable. Understanding such transformation processes is highly relevant in the light of achieving our society’s sustainable development goals and solving grand challenges such as poverty alleviation and securing water or food supply. The explanations and models of the relatively young field of transition research offer to business sustainability a multilevel understanding of the dynamics that drive or hamper change in societal systems. Establishing links to such explanations and models can be helpful to better

understand the role of business in society and its impact on sustainable development.

Definition

The expression “Triple Bottom Line” (also referred as to 3BL) has been coined by John Elkington in the 1990s in his book *Cannibals with Forks: The Three Bottom Line of 21st Century Business* published in 1997.

The main idea behind the Triple Bottom Line model is that company’s long-term success should be measured on the basis not only of the

Transparent Reporting

- [Media Ethics](#)

traditional financial bottom line but also of social and environmental performance.

The Elkington's model involves three main lines: the economic one (profit or loss) and the social and environmental ones.

The Framework

The term "Triple Bottom Line" has been introduced by Elkington in 1997, building on the foundations of Meadows et al. (1972) and Bruntland (1987), aiming at measuring not only the company's economic performance but also the social and environmental ones. This approach is based on a wide notion of stakeholder that is identified as any entity upon which company's activity may produce, directly or indirectly, an impact. According to the Triple Bottom Line, the attention is not based only on shareholders and on economic results, but it implies the attempt to satisfy all stakeholders' expectations including those related to the environment. Thus, two more bottom lines (social and environmental concerns) are introduced in addition to the traditional one (profit or loss).

The three lines – that should be analyzed according to an integrated approach – stand for society, economy, and environment. In this regard, Carter and Rogers (2008) define the Triple Bottom Line as the "strategic, transparent integration and achievement of an organization's social, environmental and economic goals."

The Triple Bottom Line model – as explained in the book *Cannibals with Forks: The Three Bottom Line of 21st Century Business* – is a way of assessing and reporting business performance based on three main areas: social (people), environmental (planet), and economic (profit) (Elkington 1997).

The "cannibals" are the companies, while the "fork" refers to sustainable business as a tool to progress into the "civilization process" (Fig. 1).

The above-stated areas – or three Ps as coined by Elkington's consulting firm "Sustainability" – are the components of the bottom line assuming the following meanings:

- People include the employees involved in a company's activity and the wider community where a corporation operates; the general aim is to ensure social justice. With reference to "people," a Triple Bottom Line approach implies the development of business producing mutual benefits for shareholders, employees, and the community as well; for example, a company committed to Triple Bottom Line model would not use youthful workforce, would pay fair salaries, and would secure working conditions.
- Planet refers to the environment upon which companies should reduce their ecological footprint as much as possible; the general goal is to guarantee environmental quality. The adoption of a Triple Bottom Line model requires companies to safeguard the natural setting by benefiting it or, at least, by reducing the potential damage due to company's activity.
- Profit that identifies the traditional Bottom Line should be implemented aiming at economic prosperity, avoiding damages for the other two dimensions (people and environment).

The adoption of the Triple Bottom Line approach requires companies a revolution of thinking and acting in no less than seven dimensions:

1. Markets: the first revolution is based on the use of market as Elkington identifies sustainability as a source of commercial opportunity for competitive companies.
2. Values: the second revolution focuses on the change in human and social values, driving toward a greater emphasis on social and ethical values rather than a merely economic view.
3. Transparency: the third revolution is powered by the increasing global transparency implying that companies' sustainability performance will increasingly be benchmarked and ranked by external stakeholders.
4. Life cycle technology: the fourth revolution involves a shift from companies focusing on the acceptability of their products at the point of sale to their performance from cradle to the grave.

Triple Bottom Line, Fig. 1 Triple Bottom Line's three "Ps"

5. Partnerships: the fifth revolution is characterized by the creation of new types of cooperation between companies and activist groups.
6. Time perspective: the sixth revolution implies the shift from the short-term approach to a long-term perspective.
7. Corporate governance: the last revolution refers to a new definition of ownership rights in company assets and of ways companies are managed and controlled.

The Triple Bottom Line model has been adopted by many international organizations such as the United Nations in order to clarify sustainability concept; in 2005, United Nations stated that "We reaffirm that development is a central goal in itself and that sustainable development in its economic, social and environmental aspects constitutes a key element of the overarching framework of United Nations activities" (United Nations 2005).

The Triple Bottom Line has established itself as an umbrella concept, linking its meaning to other similar expressions causing some overlaps: indeed, it is additionally recognized as "corporate social responsibility" or as "sustainability" (Sheehy and Farneti 2020).

The most popular definition of sustainability is "[...] a process of change in which the exploitation of resources, the direction of investments, the orientation of technological development, and institutional change are consistent with future as well as present needs and further that sustainability must meet the needs and aspirations of the present without compromising the ability of future generations to meet their own needs" (Brundtland Commission 1987).

With reference to corporate social responsibility, in 1953, Howard Bowen's *Social Responsibilities of the Businessman* provided the following definition: "the obligations of businessmen to pursue those policies, to make those decisions, or to follow those lines of actions which are desirable in terms of objectives and values of our society" (Bowen 1953). In 1960, Davis argued that corporate social responsibility refers to "businessmen's decisions and actions taken for reasons at least partially beyond the firm's direct economic or technical interest" (Davis 1960), while Frederick stated that "social responsibility in the final analysis implies a public posture toward society's economic and human resources, as a willingness to see that those resources are used for broad social ends and not simply for the narrowly circumscribed interests of private persons and firms" (Frederick 1960). It is clear how the Triple Bottom Line model is linked to sustainability and corporate social responsibility concepts as it emphasizes the need of an integrated approach among the three dimensions: economic, social, and environmental.

Limited research has shown that there are three main advantages from adopting this model: increased revenue and market share, increased employee retention, and increased community support (Quinn and Baltes 2007; Markely and Davies 2007).

Interest in the Triple Bottom Line has been growing rapidly across publicly traded companies, as well as private and nonprofit organizations. The first known public company to adopt the Three Bottom Line model was Shell in 1998, followed by other companies such as Nike, Texaco, AT&T, IBM, Hewlett-Packard, and Dow Chemical (Bishop and Beckett 2000; Raar 2002).

Summary

In its broadest meaning, the "triple bottom line" approach identifies a global responsibility perspective based on a multidimensional assessment of performance, including not only the economic dimension, but also the social, environmental, and economic ones. According to Elkington (1997),

these are the three lines that should be considered in order to assess a firm's long-term performance.

Definition

The Triple Helix concept associated to the linkages of university-industry-government to promote innovation was introduced in the 1990s by Etzkowitz and Leydesdorff (1995). They created a model that consider the interactions between university-industry-government in the knowledge society and seeks to integrate science, technology, and economic development.

These interactions between university-industry-government are crucial for improving the innovation process (Etzkowitz, 2002) and it

is “increasingly recognized as the source of new models of regional innovation that drive the translation of scientific and technical advance into economic activity” (Etzkowitz & Zhou, 2007:8).

Introduction

The Triple Helix Model is a new approach of innovation that rejects the linear innovation process and highlights the networks, linkages, cooperation between the three spheres, and circulation concept (Etzkowitz & Zhou, 2007). In the static perspective the three helices are independent, they have common characteristics, and each one has an inner center and an outer space. However, in a dynamic point of view, the interaction among university-industry-government configures a collaborative system supported by vertical and horizontal linkages to create hybrid organizations like enterprise incubators, spin-offs, and technological science parks (Etzkowitz, 2008; Zhou, 2001).

Key Issues

The Triple Helix Model considers that the three helices are interrelated and in continuous transformation in an evolutionary perspective (Fig. 1). This model can also be seen as a DNA chain, where the helices entwine and restructure themselves in the development of innovation (Dzisah & Etzkowitz, 2008; Leydesdorff & Etzkowitz, 2000).

In the Triple Helix Model, the relationships among the Higher Education Institutions, the Companies, and the Government are crucial to promote dynamics of innovation. In the innovation process, to develop and generated innovations and competitiveness there should be important linkages, cooperation, and collaboration between the three spheres.

Knowledge develops dynamically: it germinates within organizations and across institutional boundaries, and that wealth generation can take place through knowledge produced by institutional combinations (Leydesdorff & Etzkowitz, 2001). The permanent interaction between three spheres,

Industry and Higher Education Institutions (and other knowledge institutions) and Government (local, regional, national, and international), influenced the knowledge base and generated continuous innovation.

The trilateral collaboration facilitates innovation and creative development by generating new knowledge, social advantages, profits, and stimulus. It, also, reinforces new partnerships at local and national level through the funding of research programs (Etzkowitz & Zhou, 2007).

The university in its entrepreneurial perspective adopts a proactive attitude when applying the knowledge, which in turn generates more academic knowledge following an interactive, non-linear model of innovation. And companies, as they increase their technological level, they are approaching the academic level, triggering higher levels of training and knowledge sharing. The government is one helix that complements the others: companies and universities. Through its regulatory role as a public actor, it facilitates investment and cooperation, contributing to more transparent justice, promoting the innovation system (regional and national) and economic development.

A fourth helix about civil society was introduced in the study of Leydesdorff and Knowl (2012) to contemplate the local versus global. This last study points out an *N*-tuple of helices in order to captures other dimensions that influenced innovation process and knowledge-based economy process including market and governance.

Afonso, Monteiro, and Thompson (2012) developed a specific Growth Model for the Quadruple Helix. The National Innovation System Triple and the Quadruple Helix Innovation Theory also considers that a country's economic structure is based on these four helices and the economic growth is a result of the concentration of talented and productive people (Van Horne & Dutot, 2016).

Empirical studies have been developed in recent years by Natário, Couto, and Almeida (2012) and Natário, Braga, Daniel, Rosa, and Salgado (2014, 2017), to understand the role of the triple helix model in less favored regions. Following this approach, they sought to identify

Triple Helix and Innovation,

Fig. 1 The Triple Helix Model. (Source: Etzkowitz, Magnus, & Levitt, 2000)

the contribution of a higher education institution in a less favored region of Portugal, to territorial innovation dynamics. The study aimed to show how the helices foster sustainable innovation and development in less-favored regions, generating new patterns of collaboration and interaction among the helices.

Paula, Ferreira, Ferreira, and Pereira (2017) analyzed how the triple helix model stimulated the competitive advantage of companies by being used as a guideline of the company strategy and to stimulate innovations and new knowledge essential to competition, as well as by company-university and company-government interconnections. The company's initiatives in establishing relationships with universities are important to intensify and improve the quality and innovation in its product portfolio, thus gaining competitive

advantage (Carvalho, Viana, & Mantovani, 2016). According to Chen, Wu, and Yang (2016:181), "we found that the high-tech firms can improve economic situation via the cooperation with universities on the platform. . . . this study also finds that high-tech firms selecting distinct cooperation models on the platform will bring different effects on the economic performance of firms."

Future Directions

Following Leydesdorff, Ivanova, and Meyer (2019) and Etzkowitz and Zhou (2017) new perspectives toward Triple Helix Model are required, from the selection of relevant disciplines and inter-disciplines, across different levels of analysis, covering the range of policy orientations. New

conceptual frameworks can be developed in the future, integrating other theoretical domains related to innovation and knowledge management and reflecting on those with new empirical data. The investigation can be through individual and regional innovation institutions, as well as innovation modalities powered by other entrepreneur actors. New insights of Triple Helix can be considering other contextual settings, analyzing various helices, and incorporating new or alternative methodologies in analyzing the Triple Helix relationships.

Summary

This chapter aims to discuss the triple helix model as a promoter of territorial innovation dynamics. Framed within the territorial approaches to innovation, this model articulates the three helices to develop innovation. In this sense, the role of each of the helices is discussed.

Two-Tier Board

Maria Aluchna
Department of Management Theory, Warsaw
School of Economics, Warsaw, Poland

Synonyms

Dual board; Supervisory directors

Definition

Two-tier board, also known as the dual-system board, is the most important body in a corporation. It comprises the supervisory board (non-executive directors) and management board (executive directors) (Tricker 2012). The supervisory board provides oversight and monitoring over management board, yet without giving orders. It is also expected to offer counsel and advice to the executives if needed. The mandates of these two boards are kept separately. The supervisory board works collectively (Ruigrok et al. 2006; Larcker and Tayan 2011) balancing interests of all shareholders. Similarly to one-tier board also members of the supervisory board (directors) are required to have adequate knowledge, experience, and ethical stance in order to monitor the functioning of the company (Mallin 2004).

Two-tier board is usually compared to the alternative model known as the board of directors or one-tier board which is also discussed in the Encyclopedia. Two-tier board functions mostly in Germany, Austria, and Poland but is legally introduced also in other European countries such as Spain, Italy, and France, yet the majority of companies in these countries adopt one-tier model.

General Overview

Two tier board model, known also as dual board or dual system board, consists of the supervisory board and the management board. The supervisory board plays the central role in the corporate governance structure. The supervisory board is a team of high profile directors who work collectively to monitor the performance of executives and oversee the strategic development of the company. Beside the control function, the supervisory board role is also to provide advice to executives (Ruigrok et al., 2006; Tricker, 2012). Although the board does not have the legal right to give orders to executives, it bears the responsibility for the company performance. The incompetent and passive boards can act at the expense of the company and be detrimental to its survival.

Two tier board is usually compared with the alternative board model known as board of directors is also discussed in the Encyclopedia. Two tier board model system functions in Germany, Austria, the Netherlands, and Poland (Mallin, 2004). In several countries such as Italy, Spain, or France the law allows the company to choose the board model. Two tier model is then one of the existing options of the governance structure.

Functions and Duties

Similarly to the characteristics of one tier board, the work of the supervisory board is centered around its advisory capacity and oversight capacity (Larcker & Tayan, 2011). The board represents shareholders and provides oversight over the strategic development of the company. The board monitors risk management and induces the optimal contracts between the company and executives. It also assures for the company activity in accordance to the existing laws, shareholder interests and stakeholder expectations. In the language of the agency theory the supervisory board controls the rights to the residual claims of shareholders, mitigates the conflict of interests between shareholders and executives and lowers the agency costs (Fama & Jensen, 1983a, 1983b).

The principles of corporate governance (OECD/G20, 2015: 51) define the board tasks as follows: “Together with guiding corporate strategy, the board is chiefly responsible for monitoring managerial performance and achieving an adequate return for shareholders, while preventing conflicts of interest and balancing competing demands on the corporation. In order for boards to effectively fulfill their responsibilities they must be able to exercise objective and independent judgment. Another important board responsibility is to oversee the risk management system and systems designed to ensure that the corporation obeys applicable laws, including tax, competition, labor, environmental, equal opportunity, health, and safety laws. In some countries, companies have found it useful to explicitly articulate the responsibilities that the board assumes and those for which management is accountable”.

The director activity is embedded in three duties which include the duty of care, duty of loyalty, and duty of candor (Larcker & Tayan, 2011). The duty of care is defined as the director responsibility to make decision with due deliberation, be engaged in the board work, read necessary information and data, and undertake considerable discussions before decisions are made. The duty of loyalty is understood as mitigating the conflict of interests. The emergence of conflict of interest may be of the dynamic character – for instance, when the director does not have any conflict of interests but in a certain case or matter such problems may appear. Thus, the duty of loyalty requires immediate disclosure of such a potential conflict as well as refraining from taking advantage of this situation. This may mean that the director will exclude himself or herself from a particular voting or discussion. The duty of candor is defined as the obligation of the management and the board to inform shareholders about all matters which are important in the process of the evaluation of corporate and executives’ performance. Thus, the board is expected to take the necessary actions and to oversee the process of corporate reporting, the disclosure of data, and the information policy (Larcker & Tayan, 2011).

Composition and Structure

Directors Types

Corporate boards are powerful groups of strategic importance packed with high profile directors tied with a network of relations and behavioral processes (Hambrick et al., 2008) whose work determines the company performance and shareholder value (OECD/G20, 2015; Tonello, 2010). Directors bring value to the company in a number of ways – providing oversight and advise, delivering experience and know how, understanding the industry dynamics, challenging executives as well as increasing corporate reputation and legitimacy, improving communication and securing professional contacts (e.g., with business partners, investors, creditors, government, other authorities, powerful stakeholders).

The structural distinction of two tier board relies on the fundamental legal requirements that the mandates of members of the supervisory and the management board are kept separate.

Two tier board reveals a different structure as compared with the unitary board of directors. It is composed of two bodies – the supervisory board and management (executive) board. Specifically:

- The supervisory board encompasses only non-executive directors meaning directors who do not have the executive position in the company. This is a broad group of board members which may include.
 - Affiliated directors who have some material relationships with shareholders or executives, with major company suppliers or customers, company creditors or lawyers.
 - Independent directors who do not have any relations with the company of the nature listed above and were not an executive or an employee in the company for at least the last 5 years.
 - Outside directors who are recruited from the outside of the company.
 - Inside directors who usually include employees.
 - Constituency directors appointed by stakeholders.
- Management (executive) board which includes managers appointed to the executive positions of the company. Management board is a more elite body as compared with top management team or the group of directors.

Board Committees

The board tasks are executed during board meetings. Naturally, the board directors need to get prepared for such meetings, read corporate materials, collect necessary data, or ask for additional legal opinions. The work of the supervisory board, similarly, to the work on board of directors, tends to be divided into thematic sections to be discussed by specialized committees (Rezaee, 2010; Stiles, 2014). These committees most often include: audit committee, remuneration and nomination committee, risk management committee, succession committee, strategy committee, or related

party transaction committee. In addition, the formation of corporate governance, CSR, human relations committees is also noted.

Audit committee is responsible for overseeing the company's external audit and the communication between the company and the auditor. It acts with the prime goal to eliminate the risk of accounting manipulation and conflict of interest while assessing financial statement (Stiles, 2014; Tricker, 2012). Audit committee plays the central role in the control function of the board. In countries of high corporate governance standards, 100% of listed companies form audit committee within their boards. In majority of countries, the formation of the audit committee is the legal obligation of the company. Due to its essential role in corporate governance, it is recommended for the audit committee to be composed solely or in majority of independent directors. The main obligations of the audit committee include (Larcker & Tayan, 2011):

- Overseeing the practice of financial reporting and the standards of disclosure.
- Monitoring the application of accounting policies and practice.
- Monitoring the selection of the external auditor.
- Assuring for regulatory compliance.
- Assuring for internal control process.
- Monitoring the risk management policies.

Remuneration (compensation) committee is responsible for structuring the compensation schemes for the CEO as well as for other executive officers (Stiles, 2014). Its tasks encompass setting corporate goals expressed in financial, market, or organizational measures which illustrate their achievement or failure to achieve them. It also links these measures to selected components of the executive pay including fixed, variable, bonus, stock options, long term incentive program, deferred compensation and severance pay. Similarly to audit committee, compensation committee operates in 100% of listed companies in the USA and the UK. It is recommended that remuneration committee is fully or in majority composed of independent directors. The main

obligations of the audit committee include (Larcker & Tayan, 2011; Stiles, 2014)

- Setting the compensation for CEO and other executives.
- Formulating the performance-related goals with the corresponding performance measures and pay components.
- Deciding about the appropriate compensation structure.
- Overseeing CEO performance and the achievement of formulated goals.
- Advising on the pay of the non-executive directors.

In addition, the nominating, strategy and risk management committees are frequently formed within the boards. The nomination committee is responsible for recommending to the board individuals to be nominated as directors. The committee evaluates new candidates and current directors, while also hires consultants to assist in the process of succession. Directors in the strategy committee review corporate strategy and provide counsel to executives on the directions of the company development. The risk management committee reviews and recommends to the board the risk management and internal audit policy. In companies characterized with significant ownership concentration, the related party transaction is formed to monitor all transactions within the group with affiliated units.

Structural Shortcomings

As it is signaled above, two tier board is characterized by the separation of the executive and control functions. Such distinction between supervision and management may improve the objectivity and independence of non-executive directors. At the same time, however, it may be detrimental to the information flow and communication between these two bodies and may affect the quality of sessions between supervisory and management boards. In line with this argument the evidence from countries such as Italy, Spain, or France is used. While in these countries law

allows the company to choose the board model between one tier and two tier model, the vast majority (95%) prefer to organize its board according to the one tier model.

The influence of large shareholders on the appointment of board members is another essential topic of the functioning of the dual board. While in many countries shareholders may vote in groups (so that each shareholder group will have its representatives proportionally to the percentage of shares controlled), still block holders tend to dominate the board. This translates into the control over the board work and its agenda by large shareholders which may be at the cost of minority investors (Shleifer & Vishny, 1997).

Often the board may become a place for fights and conflicts between shareholders (McNulty, 2014; Tricker, 2012). This is observed for both one tier and two tier boards. The coalitions amongst shareholders are formed to proceed with certain resolutions referring to executive appointments, dividend payouts, or investment plans. The conflicts between minority and dominant shareholders are most often observed in countries and companies characterized with significant ownership concentration (continental Europe) and weaker investor protection (Asia, Latin America). Such conflicts when disclosed to the general public usually have a negative impact on firm valuation.

Finally, similarly to one tier model also the practice of the dual board reveals the existence of the interlocking directorates' phenomenon (Hillman & Dalziel, 2003; Pfeffer & Salancik, 1978). The links which secure access to scarce resources are formed between executive and supervisory boards or between supervisory boards of different companies. It may also happen that the executive director will serve as the non-executive director on the board of affiliated companies. Yet, the law usually forbids the situation that the executive director in the parent company (company A) would be the supervisory board member in the affiliated company (company B) to monitor the executives (in company B) who are at the same time the members of the supervisory board in the parent company (company A).

Behavioral Aspects

Boards are teams of high profile directors and as such they undergo the mechanisms of the group work (Pye, 2014) both in the case of two and one tier boards. The board dynamics, communication style, leadership patterns, and culture emerge in the process of the interactions between directors. Such interactions include formal meetings as well as informal situations. Existing literature provides interesting analyses on the conflict avoidance, cooperation of directors in board together, decision-making process and the emergence of values and norms. The behavioral processes are difficult to study and even more difficult to manage and control. Yet, they are viewed as one of the key factor to determine the quality of the board work. Naturally, the board structure and composition as well as the presence of procedures in place shape the behavioral patterns.

Studies identify behaviors of directors who intend to achieve certain goals while serving on the board. Tricker (2012) lists a number of games which directors play. These games include forming alliances and coalitions, conspiracy of silence cronyism, deal making, dereliction of duty, empire building, hidden and personal agendas, lobbying and sponsoring, log rolling, competing, snowing, manipulation, and window dressing.

Finally, the dynamics of the board work leads to the emergence of certain board culture which is defined as a collection of behaviors, norms, and values which drive director's work and engagement. Depending on the typology the board styles include:

- Active and passive boards.
- Financially and industry oriented boards.
- Board following the style of rubber stamp, representative board, country club board or professional boards.

National Versions

Two tier board is adopted in many companies. Its structure and the general construct is similar to the

models of the unitary board, yet some differences are observed. The comparative analysis reveals national differences with respect to the board composition, structure and practice. Below a brief characteristics of board in selected countries is presented (Aluchna, 2014; Mallin, 2004; Monks & Minow, 2004; Tricker, 2012):

- The German board is composed of on average 18–20 directors. According to the German law and the concepts of codetermination (Mitbestimmung) half of the board mandates are guaranteed for the representatives of employees. The remaining half of the board seats are taken by the representatives of shareholders and independent directors. Traditionally, large German banks appointed their representatives on the boards. Currently, the banks engagement is lower (estimated that ca. 30% of directors are bank representatives). In the case of large German companies, the presence of independent directors is estimated at 20–25%, with ca. 25–30% presence of female directors. It may look however different for smaller companies with concentrated ownership. Audit and remuneration committees are formed in 100% and nearly 100% of German boards, respectively.
- The Polish board is significantly smaller than its German peer and encompasses 6–7 directors. Majority of the board members are affiliated directors with the participation of independent directors at the level of ca. 20%. Women make for 13% of board members. Following the law 100% of companies form audit committee, while the remuneration committee is found on ca. 30% of boards.

Trends and Best Practice

The growing interest in the studies on the board composition, structure, and performance as well as the exchange of experience on the functioning of unitary and dual boards lead to better understanding of the work and processes. Studies report a significant dynamics of procedures of the board work and add to the formulation of a number of

guidelines and best practice. With the globalization of the stock market, the differences between unitary and dual board are diminishing since the key changes of the growing role of independent and female directors, response to stakeholder expectations, improvement of the board work, its evaluation and performance, as well as the identification of board working styles are similar. The key trends which also refer to the unitary board are discussed below.

Independent Directors

Independent directors are believed to deliver effective and objective monitoring free from the influence and pressure of various investor groups and from the management (Bhagat & Black, 1998, 2002; Gay, 2001; Gordon, 2007; Langevoort, 2004). Independent directors' goal is to add to accountability of the board, to deliver the highest ethical standards and to create shareholder value. Despite some criticism many studies indicate their positive impact on the financial performance (Duchin et al., 2010; Knyazeva et al., 2013; Nguyen & Nielsen, 2010) and social and relational capital (Johnson et al., 2013).

The analysis of independent director's presence on board reveals several shortcomings related mostly to the lack of motivation, insufficient industry expertise and weaker position within the boardroom.

Diversity and Female Directors

Numerous studies indicate that boards which reveal greater diversity perform better. The positive role of diversified board is related to the presence of directors with various backgrounds who add to the board discussion, may be more sensitive to non-routine changes in the environment and risk management as well as may be more responsive to stakeholder expectations. Diversity enriches leadership and creativity (Ferreira, 2010).

Within this line of research the participation of female directors is viewed as a corporate response to the growing women's presence in business and remains a measure to improve the quality of board work. Studies indicate a significant increase of female directors and even greater increase of

number of boards with at least one female director. The shortcoming of the process relates to the tokenism which describes situations when women are appointed to the board for the purpose of instrumental legitimacy. This limits the number of women participating on board while leading to multiple mandates by few successful female directors who are offered numerous board seats.

Stakeholders

With the consequences of globalization and growing stakeholder pressure companies need to adjust their strategies and operation (Donaldson & Preston, 2008; Verdeyen et al., 2004). These reforms are also expected at the board level – directors should acquire new skills and show understanding as social and environmental challenges and respond to new stakeholders' expectations (Khan et al., 2013; Rao & Tilt, 2016; Webb, 2004). As research document there is a link between a specific board characteristics and its engagement in improving the company reputation and performance. Particularly with respect to social and environmental results (Mallin and Michelson, 2011; Post et al., 2011, 2013; Mallin et al., 2013; Shaikat et al., 2016).

Best Practice and Recommendation

Corporate governance best practice offers recommendations to structure supervision and control. A substantial part of these recommendations addresses the board specifically emphasizing the following aspects (OECD/G20, 2015; PWC, 2017; Tricker, 2012):

- Appointing responsible, experienced and competent individuals of strong ethical stance. To be effective the board should be composed of committed and engaged directors, open to cooperation and contributing to the company. In addition, board directors should participate in trainings and continuously develop their knowledge and skills in order to be able to adjust to the changing requirements of companies and their environments.

- Assuring for strong independence on the board.
- Providing inclusion of stakeholder expectations to creating shareholder value, review of strategy and assessment of corporate performance.
- Assuring for effective board work with the formation of committees, collecting data, fulfilling all board responsibilities and tasks.
- Assuring high transparency standards strengthen with the regular self-assessment and procedures after the evaluation of the board.
- Assuring for board documentation and reporting (minutes).

Two Tier and Sustainability

In line with the identified relationships between corporate governance and sustainability research reveals the essential role of the supervisory board for ESG performance and disclosure. While the growing stakeholder and regulatory pressure stimulates companies to change their business mode and to minimize their negative impact on the natural environment and society, the board is expected to adjust accordingly. In consequence, the board tasks and responsibilities change towards greater attention devoted to issues such as climate change, GHGs emissions, waste management, inclusion and social inequality. The board directors need to take trainings and acquire new skills. Overall, the corporate culture and stakeholder orientation of the company, greater presence of female and independent directors on board, functioning of the specialized CSR/ sustainability committee on board as well as the chair orientation are found to be positively correlated with sustainability performance and disclosure.

Summary

Two tier board model (dual board, dual system board) consists of two separate corporate bodies – the supervisory board and the management board. Similar to the one tier model the supervisory board plays the central role in the corporate governance structure. It included only non-executive

directors, both affiliated and independent. The board directors work collectively to monitor the performance of executives, oversee the strategic development of the company and to provide advice to executives. Its main task is to represent the interest to shareholders and assure for the company development.

U

Ubuntu

Sinikiwe Mzezewa
Department of Commercial Law, University of
Cape Town, Cape Town, South Africa

Introduction

Ubuntu cannot be defined with precision, yet it forms part of uniquely South African jurisprudence. It is associated with how human beings ought to treat each other. Bennet (2018) argued that establishing a precise and definite meaning of *ubuntu* is impossible. In that light *ubuntu* can only be understood in its connotation, shades of meaning that are associative, expressive, attitudinal, and evaluative (Bennet 2018; Mokgoro 2012). It is something that can only be observed from the living experiences of indigenous black persons (Mokgoro 2012). In that light the connotation of *ubuntu* is expressed as group solidarity, conformity, compassion, respect, human dignity, humanistic orientation, and collective unity (Mokgoro 2012). It is understood as a concept that is deeply rooted in African indigenous societies (Gade 2011).

According to Bennet (2018), the underlying meaning of *ubuntu* is the right way of being a human being and being a human being through the community. Archbishop Tutu during the Truth and Reconciliation Commission emphasized African morality and self-worth and highlighted

ubuntu as a way to deal with the pain of the past and work toward forgiveness and a common feature of interdependent people (Bähre 2002). Bähre (2002) conducted empirical research on financial mutuals in Cape Town found that *ubuntu* can mean many things to different people. During his fieldwork, he found that his research subjects did not refer to *ubuntu* to explain their behavior, they emphasized helping each other, and when asked if helping each other is *ubuntu*, they agreed (Bähre 2002). Gade (2012) also conducted a qualitative investigation; the different interpretations of *ubuntu* found that there is no consistency in the way in which indigenous persons describe *ubuntu*; it is either described as a moral quality of a person or a phenomenon according to which persons are interconnected.

Ubuntu and the South African Law

Although *ubuntu* was part of the indigenous South African living experience, it was not included in the law. The Constitutional Court in *Azanian People's Organisation (AZAPO) and Others v President of the Republic of South Africa* explained that the word was included in the Interim Constitution (Constitutional Court of South Africa 1996). The word was omitted in the final constitution, except paragraph 22 of schedule 6, which preserves the epilogue of the interim constitution (Muvangua and Cornell 2012).

In private law, the focus is on the actual relationship between the persons involved and the appropriate order as a remedy which considers the need to do justice between individuals. The use of *ubuntu* in contracts is quite contentious and has resulted in numerous debates by the courts and academics. This is because there is a lack of contextualization of *ubuntu* in the context of contracts. *Ubuntu* is equated to other common law principles such as good faith and public policy. In that light, the courts are unclear, and the law is unclear regarding contracts and *ubuntu*. *Ubuntu* is a constitutional value; the question is always how the courts can interpret *ubuntu* in contracts between the parties. For example, in the constitutional case of *Barkhuizen v Napier*, the appellant was an insured in a short-term insurance contract with the respondent. In this case, the insured instituted a claim against the insurer who raised a special plea that it was released from liability because the appellant had failed to institute an action within 90 days as stipulated in the contract. The appellant argued that the period specified in the contract contravened the constitutional right to access to courts. Justice Ngcobo who penned the majority judgment noted that public policy considers the need to do simple justice between individuals which is informed by *ubuntu*. Justice Ngcobo equated *ubuntu* to public policy; he did not elaborate further; it is unclear whether *ubuntu* and public policy are interchangeable or are words that denote the same meaning. The court found that time limitation clauses are permissible; the right to access to courts can be limited if justifiable, fair, and reasonable (Constitutional Court of South Africa 2007).

In an unreported High Court matter of *Mall Space Management v Liberty Group Limited*, the applicant argued that the common law principles of contract law should relax the principle that a mandate may be terminated at any moment by the principal in light of *ubuntu* and fairness. The court found that given the circumstances, in which the parties had a contractual relationship of over 20 years, 5 days' notice to terminate the contract was unreasonable and offending constitutional values of *ubuntu*, fairness and dignity. The court granted a court order that interdicted the respondents from terminating the agreement or mandate

between the applicant and the respondents for 6 months (Gauteng Local Division High Court of South Africa 2018). The judgment appears to be an example of judgments that Judge Wallis (2016) warned against in an article where he explained the importance of commercial certainty. Judge Wallis argued that the problem with the judgments is the suggestion that enforcement of contractual obligations is dependent on a judicial sense of fairness, reasonableness, and good faith as opposed to the terms of the contract. He also noted that the other problem is that there is no guidance on how the descriptors of *ubuntu* are to be made applicable in the context of contractual relationships (Wallis 2016). According to Hutchison (2017), commercial certainty is a policy choice; therefore the "underlying" value of good faith could instead be foregrounded if this was found to be in line with a new African policy direction that the Constitutional Court wished to follow.

Ubuntu is also used in property cases, for example, in the constitutional case of *Shoprite Checkers (Pty) Ltd v MEC for Economic Development, Eastern Cape*, the appellant held a grocer's wine liquor license enabling it to sell wine and grocery on the same premises. The Eastern Cape Act changed and provided that wine licenses continue for 10 years and that after 5 years they could be converted to registrations permitting the sale of liquor from dedicated premises. The issue was whether the license constituted property and whether the promulgation of the Act led to the deprivation of property rights. The court found that a license constituted property. The court further discussed the nature of property rights in line with the Constitutions. It found that property is not an absolute right and that the Constitution envisages a society based on the fundamental values of dignity, freedom, and equality. The court emphasized that:

The notion that we are not islands unto ourselves is central to the understanding of the individual in African thought. It is often expressed in the phrase *umuntu ngumuntu ngabantu* which emphasises communality and the interdependence of the members of a community and that every individual is an extension of others.

In that light, the court explained that property should also serve a public good. The court

confirmed the declaration that Shoprite had been deprived of its property (Constitutional Court of South Africa 2015).

The Companies Act does not mention *ubuntu*. Nonetheless, King IV (2016) mentions *ubuntu*. Given that corporate governance deals with processes and functions of companies, therefore, *ubuntu* can be used to inform the process of decision-making. King IV defines corporate governance as the exercise of ethical and practical leadership by the governing body. King IV further defines ethics as considering what is good and right for the other and can be expressed in terms of the golden rule to treat others as you would like to be treated. Also, ethics are the ethical values applied to decision-making and the relationship between the organization, stakeholder, and the broader society. King IV also acknowledges the organization as an integral part of the society which is supported by *ubuntu*. The practical implication of the concept is not well articulated; King IV merely states that it means that there should be a common purpose to all human endeavors which is based on service to humanity (Institute for Directors 2016). Taylor (2004) contextualized *ubuntu* and argued for a framework for ethical business decision-making. Taylor argued that *ubuntu* must be a model for decision-making in business – which means that an action is right insofar as it promotes cohesion, reciprocal values among people. Further, an action is wrong insofar as it damages relationships. Taylor outlined the steps of decision-making in businesses as follows: analyze the situation, take action, and test it against the components of *ubuntu* (Taylor 2004).

In the sphere of criminal law, *ubuntu* is a vehicle for restorative justice. One of the first cases to use the concept of restorative justice was *S v Makwanyane*; the Constitutional Court found that the death penalty is unconstitutional (Constitutional Court of South Africa 1995). The court affirmed that *ubuntu* demands a system of justice that seeks to heal the rift in the society caused by the wrongdoer (Muvangua and Cornell 2012). Restorative justice is also used in the law of defamation, for example, in *Dikoko v Mokhatla*, the Constitutional Court ordered an apology instead of a quantum of damages to address the

need for reconciliation and social harmony (Constitutional Court of South Africa 2006; Bennet 2018).

Most legal concepts require precision for the purposes of legal certainty; *ubuntu* does not meet the requirement. Nonetheless, the courts have attempted to show how *ubuntu* can be used in different cases to reflect the living practices of South Africans.

Summary

For decades, one of the most popular ideologies in South Africa is *ubuntu*, pronounced oo-boon-too. It is basically an umbrella term that is used to describe how human beings ought to treat each other. This chapter gives a general understanding of *ubuntu* from different perspectives of law, namely, contracts, property, criminal law, company law, and delict.

UK Corporate Governance Code (2010)

Louise Gorman¹ and Anne Marie Ward²

¹Technological University Dublin,
Dublin, Ireland

²Ulster Business School, Ulster University,
Newtownabbey, UK

Synonyms

Board Behaviour; Combined Code

Description

The *UK Corporate Governance Code (2010)*, hereafter called the *UKGC Code*, provides the framework of guidelines on best practice in corporate governance for corporations listed on the main markets of the London and Irish Stock Exchanges. The *UKGC Code* has statutory backing for listed corporations as compliance with the *UKGC Code* is a requirement of the Financial Conduct Authority's *Listing Rules*. Corporations listed on the London Stock Exchange must comply with the *Listing Rules* under the Financial Services and Markets Act (2000). Moreover, listed corporations must disclose that they have complied with the *UKGC Code* or provide explanations where they have not. The *UKGC Code* originates from the *Cadbury Report (1992)*, the recommendations of which were developed in the *Combined Codes* of 1998, 2003, 2006, and 2008. The creation of the *UKGC Code* was a primary outcome of the *Walker Review of the Effectiveness of Corporate Governance in the UK Banks and Other Financial Institutions (2009)* (the *Walker Review*). Relative to prior codes of best practice, considerably more encouragement is given to boards of directors to follow the spirit of the *UKGC Code* as well as its letter. Sustainable performance as a means of long-term wealth generation is a dominant theme. This entry presents the background to the *UKGC Code* and discusses its principles and provisions with a focus on those that are distinct from previous guidelines in place in the UK. The entry concludes by evaluating the extent to which the *UKGC Code* serves to promote accountability and corporate value creation.

Background

Following the financial crisis and the publication of the *Walker Review* in 2009, the Financial Reporting Council (FRC) reviewed the *Combined Code (2008)* and, in June 2010, replaced it with the *UKGC Code*. The 2010 edition of the *UKGC Code* consists of 18 main principles and 52 provisions which fall under 5 categories: board leadership, effectiveness, accountability,

remuneration, and relations with shareholders. Pursuant to the recommendations of the *Walker Review*, many of the provisions of Section E of the *Combined Code* (2008) which dealt with institutional investors were removed and replaced by the separate *UK Stewardship Code* (2010), which aims to promote the generation of long-term returns to shareholders. Relative to the *Combined Code* (2008), the *UKCG Code* places more emphasis on risk management and external board evaluation.

The *UKCG Code* (2010) is reflective of the *Combined Code* (2008) framework in that many of its guidelines are set out in quite general terms so as to allow for variation in corporate size and circumstances. Like its predecessor, it is adopted on a “comply-or-explain” basis. “Comply-or-explain” means that a corporate must either comply with the *UKCG Code*’s principles or explain why it has not done so. The main idea behind this mechanism is to create a dialogue between investors and corporates (O’Dwyer 2014). If the corporate fails to adequately explain non-compliance with *UKCG Code* principles, or investors are dissatisfied with the explanation given, the investors can then use their rights to question the board (O’Dwyer 2014); alternatively they can sell their shares in the corporate. The *UKCG Code* discourages the use of “boilerplate” or meaningless explanations for non-compliance (preface, para. 7). Ultimate responsibility remains with the investor to judge disclosures and, if dissatisfied, voice their concerns with management or sell their shares in the corporate. One of the more novel aspects of the *UKCG Code* is its encouragement of board chairmen to report personally to shareholders as to how the principles relating to the role and effectiveness of the board have been applied (preface, para. 7).

Board Leadership

Many of the recommendations in respect of board leadership originate in the *Walker Review* (2009). The *UKCG Code* advises every corporate should be headed by an effective board which is collectively responsible for the long-term success of

the corporate (principle A.1). Heretofore, best practice principles in the UK did not specify the “long-term” nature of this responsibility. Indeed, the *UKCG Code*’s introduction begins by clarifying that “the purpose of corporate governance is to facilitate effective, entrepreneurial and prudent management that can deliver the long-term success of the company” (“Governance and the Code,” para 1). Thus, from the outset, the *UKCG Code* encourages board level decision-making toward sustainable improvements in corporate performance and stable growth in wealth. The role of board chairman is defined in extensive terms. While this role was addressed to a considerable extent in previous guidance, the *UKCG Code* is the first to devote a principle to the chairman. The chairman’s responsibility for board leadership and ensuring the board’s effectiveness in all aspects of its role (principle A.3) extends to promoting a culture of openness and debate by facilitating the effective contribution of non-executive directors in particular and ensuring their constructive relations with executive directors (supporting principle A.3). Consistently, nonexecutive directors are expected to constructively challenge and help develop proposals on strategy (principle A.4). This principle also represents a deviation from the approach taken in previous guidance where the leadership role of nonexecutive directors was not exclusively addressed. Boards are advised to appoint one of the independent nonexecutive directors to be the senior independent director to provide a “sounding board” for the chairman and to serve as an intermediary for other directors when necessary (provision A.4.1).

Board Effectiveness

The *UKCG Code* sets out as a main principle that the board, and its committees, achieves a balance of skills, experience, independence, and knowledge of the corporate to enable them to discharge their respective duties and responsibilities effectively (principle B.1). While the importance of balance in these respects was acknowledged in the *Combined Code* (2008, principle A.3), the

UKCG Code promotes their significance as a basis for effectiveness at both board and committee level. Alongside balance, the importance of diversity on the board is emphasized to a much greater extent than was previously the case. The *Combined Code's* (2008) guidance toward a formal, rigorous, and transparent procedure for the appointment of new directors to the board is retained (principle B.2). However, a supporting principle advising that appointments be made on merit, against objective criteria is expanded upon, to advise that due regard should be given to the benefits of diversity on the board, including gender. Consistent with prior recommendations, the board is advised to undertake a formal and rigorous annual evaluation of its own performance and that of its committees and individual directors (principle B.6). The *UKCG Code* goes somewhat further in this respect by introducing a new supporting principle that the chairman should act on the results of the evaluation by recognizing the strengths and addressing the weaknesses of the board and, where appropriate, proposing new members be appointed to the board or seeking the resignation of directors. The inclusion of such advice illustrates quite effectively the *UKCG Code's* encouragement for boards to comply with the spirit as well as with the letter of the *Code*, explicitly, to avoid taking a “box-ticking” approach. The guidance for FTSE 350 corporations is more demanding than in previous guidance. These corporations are expected to have their performance evaluation facilitated by an independent external facilitator at least every 3 years. Moreover, the *UKCG Code* introduces a new provision that all directors of FTSE 350 corporations should be subject to annual election by shareholders (provision B.7.1). Such frequent reelection had not been specified in the *Combined Code* (2008). The time requirements associated with a board position and the risk of directors becoming overburdened were already addressed in a considerable level of detail in the *Combined Code* (2008, supporting principle A.4; provisions A.4.3 and A.4.4), yet the issue was not addressed as a main principle. As a result of concerns raised in the *Walker Review* (2009), the *UKCG Code* gives

this issue greater prominence by guiding that all directors should allocate sufficient time to the corporate, to discharge their responsibilities effectively (principle B.3).

Accountability

Reflective of its postcrisis construction, the *UKCG Code's* guidance on financial and business reporting is more rigorous, particularly with regard to communicating its strategy for delivering long-term value to shareholders. The board is instructed to include in the annual report an explanation of the basis on which the corporate generates or preserves value over the longer term and the strategy for delivering the objectives of the corporation (provision C.1.2). Greater emphasis is placed on the board's responsibility for risk management with regard to determining the nature and extent of the significant risks it is willing to take in achieving its strategic objectives and for the maintenance of sound risk management and internal control systems (principle C.2). Heretofore, the board's role in this respect was addressed in supporting principles, in terms of working within a framework of prudent and effective controls that enable risk to be assessed and managed and satisfying themselves that systems of risk management are robust and defensible. While the *UKCG Code's* guidance on the role and responsibilities of the audit committee remains relatively similar to that offered within the *Combined Code* (2008, principle C.3), the FRC's work on the *UKCG Code* was followed by a revision and updating of its specific “Guidance on Audit Committees.” This individual guidance was issued in 2012 (FRC 2012).

Remuneration

The *UKCG Code* strongly guides boards to structure remuneration such that incentives are created to maximize corporate value in the long term. The *Combined Code's* (2008) recommendation that a significant proportion of executive directors' remuneration should be structured so as to

link rewards to corporate and individual performance is retained (principle D.1). However, the *UKCG Code* supports this principle by adding that the performance-related elements of executive directors' remuneration should be stretching and designed to promote the long-term success of the corporate. The *UKCG Code* recommends that payments and share option grants made under incentive schemes should be subject to performance criteria reflecting the corporate's objectives, including nonfinancial performance metrics where appropriate. Furthermore, remuneration incentives should be compatible with risk policies and systems (schedule A, para 5). The recommendations of the *Walker Review* are echoed in the advice that boards should consider the use of measures that permit the corporate to reclaim variable components of directors' salaries in exceptional circumstances of misstatement or misconduct (schedule A, para 7).

Relations with Shareholders

Since the *UKCG Code* is accompanied by the separate *Stewardship Code*, its recommendations in relation to shareholders pertain only to the board's position and are thus more limited than those of the *Combined Code* (2008, section D). While responsibility for ensuring that a satisfactory dialogue with shareholders continues to be considered to reside with the board as a whole (principle E.1), the supporting principles add that the chairman should take responsibility for ensuring that all directors are made aware of shareholders' concerns. Principle E.2 of the *UKCG Code* retains the *Combined Code's* (2008) recognition of the annual general meeting as the primary occasion for the board's constructive communication with shareholders (principle D.2).

Summary

The introduction of the *UKCG Code* in 2010 marked a concerted effort to encourage boards of directors to preserve the long-term value of

UK corporates. Many of the principles and provisions set a distinct tone of prudence and sustainable performance improvements, strongly resonating with lessons learned over the course of the financial crisis. Nevertheless, the *UKCG Code* maintains the flexible approach taken in previous best practice guidelines. Indeed, it might be considered something of a lost opportunity to promote more rigorous monitoring of executive behavior. For instance, given the significance of board meetings in facilitating a flow of information between executive and non-executive directors, more guidance on an appropriate frequency of board meetings may have been welcomed, particularly given the potential scheduling challenge faced by internationally diverse boards (Hahn and Lasfer 2016). Similarly, guidelines on independence remain very much open to interpretation, and it is largely left at the discretion of the board to determine if a director is independent in character and judgment (Mallin et al. 2015). That said, the *UKCG Code's* promotion of deeper consideration and more meaningful disclosures by directors, in particular by the chairman, sets a high standard of accountability which ought to foster maintainable wealth creation.

UN Declaration on Cleaner Production

Alexandra Korcheva

Sofia University “St. Kliment Ohridski”, Sofia, Bulgaria

Synonyms

IDCP; UNEP IDCP

Definition/Description

The United Nations Environment Program International Declaration on Cleaner Production (UNEP IDCP) is a voluntary and public statement by which signatories demonstrate their commitment to the implementation and promotion of cleaner production (CP) practices.

The Declaration is a statement of commitment to cleaner production practices that can be applied in all aspects of economic activity. It proves the dedication of organizations to avoid the negative impact of “end-of-pipe” solutions and devote their efforts towards creating a more sustainable pattern of production from beginning to end of production process (UNEP 2001).

It provides an opportunity to obtain a commitment from both political or public organizations (UNEP 2001) and private business leaders

worldwide. Such a declaration has been signed by a number of government agencies of different countries, and some of the biggest companies in the world, such as the BMW Group (2001). Alongside ensuring general recognition of the benefits of cleaner production, the declaration aims to promote the concept of cleaner production among different stakeholders, aiming at broader adoption of cleaner production worldwide. It is a tool for spreading of cleaner production strategies and attracting new advocates from both business and governments (UNIDO 2002).

The formulation of the declaration text was performed by The United Nations Environment Programme (UNEP) in consultation with diverse interest groups. The implementation of the declaration is coordinated and monitored by UNEP. Through signing the declaration, organizations commit to the following core principles: leadership; awareness, training, and education; integration; research and development; communication; and implementation of cleaner production practices (UNEP 2001).

Cleaner Production

The concept of cleaner production was first introduced in the 1980s. It is related to establishing more environmentally sustainable practices in production processes, and producing more environmentally friendly products and services. The most common definition of cleaner production is provided by the United Nations Environment Programme. Cleaner production is defined as “the continuous application of an integrated preventive environmental strategy applied to processes, products and services to increase eco-efficiency and reduce risks to humans and the environment” (Schaltegger et al. 2008, p. 4).

Cleaner production is regarded as beneficial to both companies that implement cleaner production practices into their processes (for example, in lowering pollution license fees), and the environment.

Establishing cleaner production practices could be done in all steps of the production process. Such practices could be associated with change in technology, changes in input materials,

change in operating practices, changes in product design, changes in waste use, changes in packaging, etc. A proactive approach towards both environmentally sound and cost-minimization approaches is conceived as the sustainable approach towards production (UNEP 2001). While the initial CP concept was oriented towards industrial production practices, in the years that followed it reshaped towards nonindustrial sectors as well (Hens et al. 2018).

Since the Rio de Janeiro Conference of 1992, cleaner production has become part of the overall sustainable development framework. Cleaner production is closely related to other sustainability concepts such as eco-efficiency, environmental sound technologies, life cycle assessment, green procurement, and zero emissions. Cleaner production and eco-efficiency have been regarded as “two sides of the same coin,” with cleaner production stressing on means and eco-efficiency – on objectives (van Berkel 2006). Both concepts are gaining momentum but there is yet room for enhancement of the strategic recognition (van Berkel 2006) and emancipation from the image of instruments for promotion of mostly environmental-protection measures as opposed to business efficiency instruments.

Nowadays, CP is also closely associated with the green economy and blue economy frameworks, as well as developing fields of business practices such as corporate social responsibility (CSR) (Hens et al. 2018).

History of UNEP Cleaner Production Activities

The World Cleaner Production Program was initiated by UNEP in 1989 (Nowak and Cichy 2008). The primary objectives of UNEP’s cleaner production activities after the initiation of the program were to raise awareness about the cleaner production concept and to promote its adoption by industry (UNEP 2001).

In 1994, as part of the results from the 1992 Rio Conference UNEP and the United Nations Industrial Development Organization (UNIDO) launched the worldwide national CP center program (UNIDO 2002).

Since the start of the program in 1994 up to 2002, the organizations established 22 cleaner

production centers where provision of industrial technical expertise, strategic environmental expertise, training, information, and policy analyses were provided (UNIDO 2002).

Since that time, cleaner production has been widely promoted as a win-win strategy to improve industrial performance and simultaneously protect the environment. Nevertheless, the commitment to adopt and practice the cleaner production concept has not been as widespread as one would like to have.

It is within the framework of the cleaner production program of UNEP that the International Declaration on Cleaner Production (IDCP) was developed. In 1998, as part of the overall strategic actions for promotion of cleaner production, UNEP prepared the International Declaration on Cleaner Production, which constitutes a voluntary public statement of commitment to the strategy and practice of cleaner production. It was presented to the public during the high-level CP Meeting CP5 in October 1998 with 67 initial signatories (UNIDO 2002). Since then, other national and international organizations continue to sign the Declaration as declaration partners. As of November 2001, the number of signatories of the IDCP totals over 1000 organizations, among which 45 national governments (UNIDO 2002). In addition to the formal commitment through the IDCP, the UNEP has also developed implementation guidelines that aim to aid organizations (UNEP 2001).

Following the development of the organizational actions for promotion of CP, the joint UNIDO-UNEP global Resource Efficient and Cleaner Production Program (RECP) was formulated and approved in 2009 (Hens et al. 2018). The first global UNIDO-UNEP RECP program meeting was held in Switzerland in October 2009 and was hosted by the Government of Switzerland (UNIDO 2020). Following the endorsement of the RECP network (RECPnet), the global RECPnet in developing and transition countries was officially established in November 2010 by 41 signatories of the RECPnet charter (UNIDO 2020) with the primary objective of the RECPnet being to contribute to the effective promotion and implementation of RECP, to foster North–South

and South–South collaboration, as well as technology transfer and policy collaboration (UNIDO 2020).

Principles and Goals of the International Declaration of Cleaner Production

The main goal of the IDCP is to encourage support for the adoption of CP practices by organizations, and promote commitment and cooperation between actors. A second goal of the IDCP is considered to be spreading awareness of the concept of CP (UNIDO 2002). The International Declaration defines cleaner production as “the continuous application of an integrated, preventive strategy applied to processes, products and services in pursuit of economic, social, health, safety and environmental benefits” (Hens et al. 2018, p. 4).

The Declaration is based on six principles that comprise the commitment of organizations. They are perceived as an action framework that provides a general overview of activities related to the adoption and implementation of signatory CP strategy (UNIDO 2002). Through the International Declaration on Cleaner Production, UNEP has been working to gain the necessary commitment from governments, from companies, from industry associations, and from academia – from all the stakeholders who have a role to play in the big picture of sustainable production and consumption (UNEP 2001).

When organizations take the decision to commit to cleaner production practices via signing a declaration on cleaner production, they are to commit to the following principles:

- Leadership
- Awareness, education, and training
- Integration
- Research and development
- Communication
- Implementation (UNEP 2001)

Upon committing to the above-mentioned principles, organizations that choose to sign a declaration are obliged to fulfill certain actions in

promotion of cleaner production practices. In accordance with the organizations’ affairs and conduct, not all recommended implementation actions may be applicable, so it is advised that they develop an individual strategy for implementing the cleaner production principles (UNEP 2001).

Obstacles for Cleaner Production Practices Implementation and Criticism

Cleaner production practices are generally rapidly infiltrating all levels of economic activity – from agriculture, manufacturing to the service sector. However, there are still certain barriers to implementing cleaner production practices to the fullest extent.

While conceptually cleaner production has been a constantly developing concept (Hens et al. 2018), it is the application of CP practices that is the most important obstacle. It has taken some time for both investors and business to acknowledge the importance of CP and reach to the understanding of economic profitability of CP businesses as well as its environmental benefits (Hens et al. 2018). However, constant efforts in promotion and education of CP advocates has had a significant effect with recent findings suggesting that environmental passion among entrepreneurs affects both entrepreneurial behavior and identity, therefore proving that entrepreneurial orientation towards environmentally sound production is passion and identity relevant (De Bernardi and Pedrini 2020).

The second obstacle towards implementing CP is related to the different levels of application and general development of policies and action between developed and developing countries. Earlier research shows that difficulties for implementing CP in developing countries is due to a number of reasons – lack of investment in such projects due to considered riskiness (Ciccozzi et al. 2003), cost and availability of feasible technologies being the case as well. In more recent times, applying CP-related practices in developing countries is still lagging behind developed countries due to various reasons – both political and governance oriented, and

incentive oriented. Research on applying CP in small and medium enterprises (SMEs) in developing countries has shown that SMEs are less likely to adopt more ecologically efficient business practices if there are no external motivators such as government regulation or community pressure (Agwa-Ejon and Fore 2011).

Summary

The International Declaration of Cleaner Production is a statement of commitment to cleaner production. Through signing this document organizations – both public and private – not only commit to implementing cleaner production practices into their processes, but communicate the idea as well.

Cleaner production has become one of the key concepts of both UNEP and UNIDO, and the UNED IDCP is a key statement of commitment that has promoted the development and spread of the notion.

Philippines

Synonyms

[Guiding principles](#); [Guiding principles for business and human rights](#); [UN human rights guiding principles](#)

Definition/Description

The endorsement by the Human Rights Council of the General Assembly of the United Nations of the United Nations' Guiding Principles on Business and Human Rights (UNGP) signaled a shift in how human rights are viewed under international law. This entry briefly discusses the international legal system and how the UNGP fits into that legal system. Furthermore, the entry also examines the theory behind the UNGP, the Protect, Respect, and Remedy (PRR) Regime. Particularly, the entry takes a look at the obligation of a state to protect human rights and provide adequate remedies for victims of human rights abuses, particularly those committed by private business enterprises. The entry also tackles the duty of private business enterprises to respect human rights standards. In examining the UNGP and its foundational framework, the entry looks at the strengths and weaknesses of the UNGP framework, particularly the fact that the UNGP uses a system of obligations derived from international law that are imposed on states and a duty to respect human rights that is imposed on private business enterprises. Lastly, it identifies possible areas for future research.

Introduction

The recently concluded World Cup held in Qatar was a source of headlines not only for the sport of soccer but also for other issues, particularly those involving human rights. The New York Times reported that "Garment workers in Myanmar earn less than \$3 a day to produce soccer apparel for Adidas. Some say they were fired after asking factory owners for a raise" (Paton 2022). The entry further states that:

The Myanmar factory underscores the continuing struggle for many of South Asia's 40 million garment workers, who have long grappled with poor working conditions and wages, and whose troubles have been exacerbated by the pandemic. Now, with the biggest sporting event in the world underway, efforts by some laborers to improve their working conditions have been met with harsh resistance and punishment. (Paton 2022)

This highlights the growing tension between legitimate corporate or business interests and the need to uphold human rights in the international community. This is especially true in this age of transnational businesses. “The question has always remained one of how to strike the fair and workable balance between profit and human welfare” (Addo 2014).

The Legal Framework

International Law

To better understand the relationship between human rights and business, a dichotomy and distinction have to be made. Businesses and the entities that operate in this area such as corporations and transnational corporations are usually actors in a domestic legal system. They are governed by domestic or state law. As such, corporations, e.g., transnational or multinational corporations, such as Apple, Amazon, or Google, are beholden to the laws of the state where they are domiciled or incorporated. They are subjects of domestic or state law and rarely are directly subject to international law.

Human rights law, on the other hand, properly belongs to the sphere of international law. Traditionally, international law deals with the conduct of states and international organizations with each other. It does not usually govern the actions or relations of individuals or corporate entities. “Clearly, international law deals with the relations of states, international organizations, and in certain cases, individual persons, whether juridical or natural” (Goquingco 2020). “While international law, in its most basic and essential form, is a system of rules and principles governing the conduct of states, the way that international law operates is very different from how most people view law” (Goquingco 2020). Domestic law is very different in the way it operates. In domestic law systems, “[t]he law is not created by the members of the system but is rather imposed on them by a higher authority” (Goquingco 2020). This is not the case for international law. International law is made, obeyed, or disobeyed by the states who made it (Goquingco 2020).

Taking this dichotomy into account, the fact remains that human rights law is clearly an international law topic and subject. Deveraturda notes that “[t]he recognition of and mechanisms for protecting human rights are most often found in conventions or treaties, as well as declarations” (2021). As such, the treaties and conventions relating to human rights law such as the 1948 Universal Declaration of Human Rights, the International Convention on the Elimination of All Forms of Racial Discrimination, the International Covenant on Civil and Political Rights, and the International Convention on Economic, Social and Cultural Rights are designed to regulate the actions of states. These treaties impose standards and, more importantly, obligations on states and not on individual persons. As has been noted, “[t]he state-based system of global governance has struggled for more than a generation to adjust to the expanding reach and growing influence of transnational corporations” (Ruggie 2007).

The United Nations’ Guiding Principles on Business and Human Rights

On 16 June 2011, the Human Rights Council of the General Assembly of the United Nations endorsed the Guiding Principles on Business and Human Rights. The UNGP presents a framework designed to enhance the respect and observance of human rights standards by businesses, particularly corporations and transnational corporations. The UNGP is founded on three principles or pillars, namely, protect, respect, and remedy, also referred to as the PRR regime. It should also be noted that the UNGP also formally recognizes “[t]he role of business enterprises as specialized organs of society performing specialized functions, required to comply with applicable laws and to respect human rights” (General Principles, 2011).

The first foundational pillar is that of protecting human rights. “States must protect human rights abuse within their territory and/or jurisdiction by third parties, including business enterprises. This requires taking appropriate steps to prevent, investigate, punish and redress such abuse through effective policies, legislation, regulations and adjudications” (UNGP, Principle 1, 2011). Clearly, the primary responsibility to protect

human rights lies with a state. It is the state's primary obligation not only as provided for in the UNGP but also as provided for in the various human rights instruments.

A state must enact measures that will allow the effective grant and implementation of human rights and human right standards within its countries. Furthermore, The UNGP further provides that this protection should extend to human right abuses perpetrated by third parties, including business or corporate entities. (UNGP, Principle 1, 2011). This is a departure from traditional thinking that human rights abuses are only committed by states or governmental actors. By providing that human rights protection is the primary responsibility of the state, the UNGP remains consistent with international law as human rights treaties and conventions are binding on states and not on nonstate actors.

Furthermore, "States should set out clearly the expectation that all business enterprises domiciled in their territory and/or jurisdiction respect human rights throughout their operations" (UNGP, Principle 2, 2011). Clearly, this sets the tone that a state is required to oversee and regulate business enterprises and their compliance with human rights standards within their jurisdiction. Moreover, this obligation of the state is not limited to the activities of businesses within their territory but to business activities that may extend beyond the territorial jurisdiction of the state.

The second foundational pillar provides that "[b]usiness enterprises should respect human rights. This means that they should avoid infringing on the human rights to others and should address adverse human rights impacts with which they are involved" (UNGP, Principle 11, 2011). As opposed to a state's fundamental duty and obligation to protect human rights, a business enterprise is obligated to respect human rights. It creates a very different obligation that takes into account that business enterprises are not the proper subjects of international law.

The UNGP does not impose any obligation on private entities, particularly corporations and transnational corporations, beyond that respecting the fundamental human rights of people. This reflects the basic principle that "human rights

apply to everyone simply by virtue of their being human. Simply put, it is that human rights are to be claimed and enjoyed by all, arising out of their inherent entitlements by virtue of being human beings" (Deveraturda 2021). As such, private entities are enjoined to respect human rights.

Moreover, the UNGP provides that "[t]he responsibility of business enterprises to respect human rights applies to all enterprises regardless of their size, sector, or operational context, ownership and structure" (Principle 14, 2011). This "responsibility of business enterprises to respect human rights refers to internationally recognized human rights – understood, at a minimum, as those expressed in the International Bill of Human Rights and the principles concerning fundamental rights set out in the International Labour Organization's Declaration on Fundamental Principles and Rights at Work" (UNGP, Principle 12, 2011). It should be noted, however, that the UNGP does allow for some flexibility in this responsibility to respect human rights. The UNGP provides that "the scale and complexity of the means through which enterprises meet that responsibility may vary according to these factors and with the severity of the enterprise's adverse human rights impacts" (Principle 14, 2011).

The third foundational pillar provides that:

As part of their duty to protect against business-related human rights abuse, States must take appropriate steps to ensure, through judicial, administrative, legislative or other appropriate means, that when such abuses occur within their territory and/or jurisdiction those affected have access to effective remedy. (UNGP, Principle 25, 2011)

The UNGP imposes on a state the obligation to provide adequate remedies and measures to allow for redress for human rights violations, particularly those committed by corporations and multinational corporations. These remedies can either be through judicial (court action), administrative, legislative, or other means. The obligation of the state to provide for adequate remedies goes hand in hand with its obligation to protect human rights. For, if there are no suitable remedies available to victims of human rights abuses, the duty of the state to protect is rendered meaningless.

It is worth noting that the UNGP also provides that there is a need “to ensure the effectiveness of domestic judicial mechanisms” (Principle 26, 2011). This includes “ways to reduce legal, practical and other relevant barriers that could lead to denial of access to remedy” (Principle 26, 2011). It is not enough for a state to provide remedies for redress of human rights violations. More importantly, the state should make sure that victims of human rights abuses are able to access the remedies.

Judicial mechanisms and the ability to access them are the core of guaranteeing effective redress of human rights abuses. More importantly, these remedies should not only be seen to be but should actually be impartial and have integrity.

Aside from providing judicial mechanism to allow for redress, the state is likewise obligated to provide alternative means for redress or remedy. Particularly, the state “should provide effective and appropriate non-judicial grievance mechanisms, alongside judicial mechanisms, as part of a comprehensive State-based system for the remedy of business-related human rights abuse” (UNGP, Principle 27). This would allow for a complimentary system to that of redress by court litigation. Furthermore, private or nonstate grievance mechanisms should also be facilitated (UNGP, Principle 28, 2011). These nonstate mechanisms would allow for early redress and may actually lead to prevention of human rights abuses as would be victims would be given a forum where their concerns may be addressed at early stages.

Strengths and Weaknesses

The issue of human rights and business is not a new one. As one author highlighted:

Fueled by the escalating reports of corporate human rights abuses, especially in the extractive and the footwear and apparel industries, the UN Sub-Commission on the Promotion and Protection (Sub-Commission), a subsidiary body of the then Commission on Human Rights composed of twenty-six more or less independent experts established a working group on business and human rights in 1998. (Ruggie 2007)

The situation has not changed. In fact, Reif provides that:

It is generally accepted that business conduct can directly result in human rights violations or render the business complicit in human rights violations committed by state or non-state actors. While domestic businesses impact negatively on human rights, the conduct of multinational corporations (MNCs) is also problematic given their operations in many nations, the Global South, and conflict-affected areas. (2017)

Moreover, another author notes that:

Some of the most severe and widespread forms of corporate human rights abuse include the dislocation of indigenous communities without compensation or consultation, the impairment of people’s health and safety due to unfit working conditions and destruction of the environment, the leaving of individuals’ data to government agents, the denial of freedom of expression and of association, discrimination and sexual harassment at the workplace, and sweatshops, bonded labor, and child labor in the transnational supply chains of global brands. (Wolfsteller and Li 2022)

While the UNGP provides a framework for interplay between human rights protection and business interests, “a broad responsibility for the protection of human rights within the corporation’s sphere of influence is still far from being universally accepted” (Wolfsteller and Li 2022). This shows that the current regime provided for by the UNGP does offer a mixed bag. There are both strengths and weaknesses.

What immediately stands out is that the UNGP are merely guiding principles. In the field of international law, the UNGP can be considered a declaration. Deveraturda provides that “a declaration is a document that in itself is not legally binding. It is often a means of stating general principles of international law, in this case the general standards of recognizing, promoting, and protecting human rights” (2021). Thus, the UNGP is not a binding instrument in the same sense that a treaty or convention is. “While not on the same plane of enforceability, a declaration express the ‘will, intention, or opinion when acting in the field of international relations,’ often leading to treaties or customary international law” (Deveraturda 2021).

This lack of binding force on the part of the UNGP is its major weakness, particularly with

reference to the second foundational pillar of business entities to respect human rights. Absent a formal legal system that forces business entities to comply with human rights obligations, there will always be a wide latitude for human rights violations. In fact, it is clear that “there is a persistent unwillingness among governments to introduce more stringent regulations for the corporate sector” (Wolfsteller and Li 2022).

Furthermore, some authors note that:

“[I]n the absence of a centralized and effective international regulatory body or system, corporate human rights accountability is regulated by a patchwork of national and international rules, laws, and standards with differing degrees of bindingness and enforceability, often dealing only with specific rights norms and/or types of companies with a particular state or region.” (Wolfsteller and Li 2022)

The very nature of the international legal system in its current form is the other major weakness of the UNGP. As has been discussed earlier, international law, including international human rights law, has for its subjects states and international organizations. International law very rarely covers the actions of nonstate actors. “[T]he international human rights regime is primarily designed to protect human rights from interference by state actors. The UN treaty regime imposes direct legal obligations only on states and applies to private businesses rather indirectly and in a very limited way” (Wolfsteller and Li 2022).

On the other hand, the fact that the UNGP is not an international treaty or convention, it neither creates new international law obligations, nor does it limit or undermine any legal obligation a state may already have under international human rights law. This allows some sort of flexibility and leeway for states to enact measures using domestic law to be able to bring business enterprises into the legal framework of which they are not naturally part of. By not creating new normative standards but rather elaborating the implications of existing standards and practices, the UNGP is able to bring into its fold and impose, in a way, certain commitments on business enterprises (Addo 2014).

The UNGP, as one author notes:

[A]re not just another layer of corporate governance but a sophisticated and refined synthesis of existing

standards and mechanisms that integrate both voluntary standards and legally compelling standards. This so-called ‘smart mix’ of governance mechanisms is original and unique to the PRR regime and underlies the importance of complementary responsibilities for all stakeholders as an indication of shared commitment to ensure the effective application of the [UN]GPs. (Addo 2014)

Summary

International human rights law has always been the domain of states and international organizations. However, the intersection of private business interests, particularly corporate profit-seeking, has resulted in clear instances wherein human rights have been violated. With states being the traditional subjects of international law, a gap on how to govern private business was a legitimate concern of the international legal system.

In June 2011, the Human Rights Council of the United Nations endorsed the UNGP. This was a radical and bold step to change how human rights are viewed, particularly with regard to private actors. Instead of making corporations, including transnational corporations subject to international law, something that has faced resistance and criticism, the UNGP introduced a framework that combined both international obligations of states with certain responsibilities on private entities.

The introduction of a framework which allows for a better realization of imposing human rights standards on private enterprises was unheard of. The UNGP, it must be remembered, “is not a governance or regulatory regime in and of itself but rather of platform of guidelines by which stakeholders may define mechanisms using either compelling regulatory mechanisms or indeed voluntary initiatives” (Addo 2014). In using the PRR (protect, respect, and remedy) regime, the UNGP has found a way of creating a system wherein states and private business entities are able to work together to be able to ensure the protection of human rights. The key characteristics of “flexibility, the smart mix of processes and substantive standards as well as the endorsement and uptake by stakeholders from different sectors”

(Addo 2014) are what make the UNGP special and potentially the answer to human rights abuses by private enterprises.

As has been discussed, the UNGP is not the perfect answer. While it does have its strengths, there are shortcomings to be considered as well. Moreover, it must be remembered that in drafting the UNGP, certain considerations had to be made particularly that it had to have the broadest possible consensus among stakeholders, particularly business enterprises, and, at the same time, it had to steer clear of imposing new, direct, and legally binding obligations on corporations (Wolfsteller and Li 2022). In some cases, the UNGP raises more questions than answers. However, it is a start to answer a compelling problem faced by today's world. It is better than nothing.

However, '[i]t remains an open question whether the responsibilities to respect and protect human rights can (and should) be translated into business principles so as to find broader acceptance' (Wolfsteller and Li 2022). Furthermore, it should also be asked "whether the aim of realizing human rights can in fact, be integrated into business practice in ways that are compatible with corporate profit-seeking in global market capitalism at all" (Wolfsteller and Li 2022). There are still no concrete answers to these questions. In fact, these are areas that future research may undertake. Ultimately, it should also be determined whether human rights standards provided for by international law can be legally enforced on private entities.

UN Principles for Responsible Investments (PRI)

Maud Helene Schmiedeknecht
ESB Business School, Reutlingen, Germany

Synonyms

[Principles for Responsible Investments; Responsible investments](#)

Definition/Description

The Principles for Responsible Investments (PRI) is "the world's leading proponent of responsible

investment” (PRI 2021a). With the development of six Principles for Responsible Investment, the PRI supports its international network of investor signatories in incorporating the environmental, social, and governance (ESG) factors into their investment and ownership decisions. The goal of PRI is to develop a more sustainable global financial system by encouraging “investors to use responsible investment to enhance returns and better manage risks” (PRI 2021a). This independent financial initiative is supported by the United Nations and linked to the United Nations Environmental Program Finance Initiative (UNEP FI 2021) and the United Nations Global Compact (UN Global Compact 2021).

Six Principles for Responsible Investment (PRI)

The six Principles for Responsible Investment (cp. Table 1) give investors guidance incorporating ESG issues into investment practice. Examples of ESG factors are numerous. Environmental factors are among others climate change, resource depletion, waste, and pollution (PRI 2020a, p. 4). Social factors include human rights, working conditions, and employee relations (PRI 2020a, p. 4). Governance factors contain for instance board diversity and structure,

executive pay, tax strategy as well as bribery and corruption (PRI 2020a, p. 4).

The topic responsible investment is growing steadily in importance. Players for instance in the financial community start to recognize that ESG factors affects risk and return. Furthermore, more and more investors ask for transparency where and how is their money being invested. On a global level, the ESG factors are increasingly incorporated into regulations, as it is seen as duty of the investors to report on (PRI 2020a, p. 4).

PRI’s Mission

The PRI aims at contributing to develop a more sustainable global financial system by steadily attracting signatories representing the professionally managed investments, which implement the PRI Principles.

This is captured in their mission:

“We believe that an economically efficient, sustainable global financial system is a necessity for long-term value creation. Such a system will reward long-term, responsible investment and benefit the environment and society as a whole.

The PRI will work to achieve this sustainable global financial system by encouraging adoption of the Principles and collaboration on their implementation; by fostering good governance, integrity and accountability; and by addressing obstacles to a sustainable financial system that lie within market practices, structures and regulation.” (PRI 2020a, p. 1)

UN Principles for Responsible Investments (PRI), Table 1 Six Principles for Responsible Investment

Principles for Responsible Investment	
Principle 1:	We will incorporate ESG issues into investment analysis and decision-making processes
Principle 2:	We will be active owners and incorporate ESG issues into our ownership policies and practices
Principle 3:	We will seek appropriate disclosure on ESG issues by the entities in which we invest
Principle 4:	We will promote acceptance and implementation of the Principles within the investment industry
Principle 5:	We will work together to enhance our effectiveness in implementing the Principles
Principle 6:	We will each report on our activities and progress toward implementing the Principles

Source: PRI (2020a), p. 6

Development of the Principles for Responsible Investment

Supported by the United Nations, the PRI is an “investor initiative in partnership with UNEP Finance Initiative FI and the UN Global Compact” (PRI 2020a, p. 36).

In 2005, Kofi Annan, United Nations secretary-general, encouraged international, influential financial institutional investors to join the development process of Principles for Responsible Investment (PRI 2021a). The group consisted of 20 persons drawn from institutions in 12 countries. They received support from an expert group consisting

of 70 persons from various sectors and organizations such as the financial sector as well as inter-governmental organizations and civil society (PRI 2021a). In April 2006, the Principles were launched at the New York Stock Exchange (PRI 2021a).

Signatories and Their Commitment

The PRI distinguishes three groups of signatories: asset owners, investment managers, and service providers (PRI 2021b). Asset owners represent the holders of long-term retirement savings, insurance, or other assets (e.g., pension funds, insurance and reinsurance companies, and foundations). Investment managers manage or control investment funds, either on its own or on behalf of others (owning not more than half of such funds). Service providers or so-called professional

service partners offer products or services to asset owners and/or investment managers, providing, developing, and promoting services that support clients’ implementation of the Principles (e.g., sustainability rating agencies).

Up to now more than 3900 investment managers, asset owners, and service providers have committed themselves by recognizing the PRI to integrate ESG factors into their investment (PRI 2021c). Together they manage more than US\$100 trillion (PRI 2021d). Since 2006, the number of signatories has steadily grown (compare current figures on the website PRI 2021d).

Organizations who want to sign the Principles have to submit the relevant declaration signed by the CEO or equivalent (cp. Table 2.), send an organization chart including the structure of the organization with all its legal entities as well as further company details, and reasons for signing the application (PRI 2021b).

UN Principles for Responsible Investments (PRI), Table 2 Signatory declarations of asset owners, investment managers, and professional service partners

Asset owner/Investment manager signatory declaration “As institutional investors, we have a duty to act in the best long-term interests of our beneficiaries. In this fiduciary role, we believe that environmental, social, and corporate governance (ESG) issues can affect the performance of investment portfolios (to varying degrees across companies, sectors, regions, asset classes and through time). We also recognise that applying these Principles may better align investors with broader objectives of society. Therefore, where consistent with our fiduciary responsibilities, COMPANY NAME commit to the following: • To incorporate Environmental, Social and Corporate Governance (ESG) issues into investment analysis and decision-making processes; • To be an active owner and to incorporate ESG issues into our ownership policies and practices; • To seek appropriate disclosure on ESG issues by the entities in which we invest; • To promote acceptance and implementation of the Principles within the investment industry; • To work with the PRI Secretariat and other signatories to enhance their effectiveness in implementing the Principles; • To report on our activities and progress towards implementing the Principles. By signing this letter, COMPANY NAME agrees to pay the annual fee and commits to completing the PRI Reporting Framework on an annual basis. COMPANY NAME confirms their current AUM is _____ bn USD. This figure was last calculated on _____. COMPANY NAME is classified as an [Asset Owner/Investment Manager]. Signed: Name: Title (CEO / equivalent): Date:” Professional service partner signatory declaration “As professional service partners, we recognise that we have considerable influence over how our clients address ESG issues. COMPANY NAME acknowledges the relevance of ESG issues to investment management, and commits to providing, promoting and improving services that support the implementation of the following Principles: • [see six Principles of Responsible Investment above] By signing this letter, COMPANY NAME agrees to pay the annual fee. COMPANY NAME confirms their number of staff is _____. COMPANY NAME is classified as a Professional Service Partner. (...)”
--

Source: cp. PRI (2021b)

The PRI is mainly funded by an annual membership fee of all signatories, scaled to each signatory's category, type, and assets under management. Furthermore, the initiative receives grants from other international organizations, governments, and foundations (PRI 2021a).

Signatories can be deleted from the directory. A reason for voluntary resignation can be that another signatory of the PRI acquired the company. In case signatories do not pay their annual fee or have not been reporting on progress, they will be delisted (PRI 2020b).

Possible Actions

There are various possibilities for investors, asset owners, and service providers to incorporate ESG issues. The following list provides an overview on possible actions (cp. Table 3).

Investors can use these principles for focusing and formalizing their responsible investment efforts. Furthermore, these principles set expectations for their internal and external stakeholders and provide a common language for all involved.

Reporting for Signatories

For all PRI signatories reporting is compulsory. Besides ensuring a standardized transparency tool for signatories' reporting, PRI gives signatories feedback to establish a continuous learning process (PRI 2021e).

Signatories have to report in a reporting tool on their responsible investment activities annually (PRI 2021e). After sign up, only the first reporting cycle is seen as a learning experience and is therefore voluntary.

Two reporting frameworks exist: one for investors and one for service providers.

The PRI has developed a new reporting framework for investors (PRI 2020c), building on the previous reporting framework with mandatory and voluntary indicators (PRI 2019a). Now a "core" and "plus" model has been introduced with various indicators. The "core" or rather process-focused components with closed-ended

questions are mandatory and require disclosure. The "plus" process- and outcome-focused components with mainly open-ended questions are voluntary (PRI 2020c, p. 6).

After publishing a senior leadership statement and providing an overview on the organization, the signatories explain their specific responsible investment practices, e.g., how they incorporate ESG factors in their investment decision-making processes, stewardship processes, and in each of their specific asset class (PRI 2020c, p. 6ff; cp. Fig. 1). It is important to notice that since 2020, PRI signatories are required to report on climate indicators too. These indicators on the performance of managing risks and opportunities regarding climate change issues are based on the disclosure framework of the Financial Stability Board's Task Force on climate-related disclosures (TCFD) PRI (2021g).

The reporting framework for service providers is split into seven modules (PRI 2019b). All service provider signatories complete the (1.) organizational overview, (2.) strategy and governance, and (3.) closing module. The remaining modules are business specific (cp. Fig. 2).

Depending on their organizational setup, circumstance, and market, signatories can adopt verification and assurance practices. If not existing yet, signatories have to establish an internal control system in order to collect and produce accurate and credible information for the ESG reports. Then, on a medium level of assurance, an internal audit will identify risks and opportunities for management and thus independently examine the internal controls. Finally, on a high level of assurance, external third-party assurance can give confidence that reported ESG information is credible or accurate (PRI 2018, p. 8).

Summary and Outlook

The Principles for Responsible Investment recognize the importance of the ESG factors and consist of a set of principles developed by a group of institutional investors (PRI 2020a). Therefore, PRI provides proposals for understanding and

UN Principles for Responsible Investments (PRI), Table 3 Possible actions per principle

Possible actions for investors, asset owners, and service providers to incorporate ESG issues	
Principle 1:	We will incorporate ESG issues into investment analysis and decision-making processes
Possible actions	Address ESG issues in investment policy statements Support development of ESG-related tools, metrics, and analyses Assess the capabilities of internal investment managers to incorporate ESG issues Assess the capabilities of external investment managers to incorporate ESG issues Ask investment service providers (such as financial analysts, consultants, brokers, research firms, or rating companies) to integrate ESG factors into evolving research and analysis Encourage academic and other research on this theme Advocate ESG training for investment professionals
Principle 2:	We will be active owners and incorporate ESG issues into our ownership policies and practices
Possible actions	Develop and disclose an active ownership policy consistent with the Principles Exercise voting rights or monitor compliance with voting policy (if outsourced) Develop an engagement capability (either directly or through outsourcing) Participate in the development of policy, regulation, and standard setting (such as promoting and protecting shareholder rights) File shareholder resolutions consistent with long-term ESG considerations Engage with companies on ESG issues Participate in collaborative engagement initiatives Ask investment managers to undertake and report on ESG-related engagement
Principle 3:	We will seek appropriate disclosure on ESG issues by the entities in which we invest
Possible actions	Ask for standardized reporting on ESG issues (using tools such as the Global Reporting Initiative) Ask for ESG issues to be integrated within annual financial reports Ask for information from companies regarding adoption of/adherence to relevant norms, standards, codes of conduct, or international initiatives (such as the UN Global Compact) Support shareholder initiatives and resolutions promoting ESG disclosure
Principle 4:	We will promote acceptance and implementation of the Principles within the investment industry
Possible actions	Include Principles-related requirements in requests for proposals (RFPs) Align investment mandates, monitoring procedures, performance indicators, and incentive structures accordingly (for example, ensure investment management processes reflect long-term time horizons when appropriate) Communicate ESG expectations to investment service providers Revisit relationships with service providers that fail to meet ESG expectations Support the development of tools for benchmarking ESG integration Support regulatory or policy developments that enable implementation of the Principles
Principle 5:	We will work together to enhance our effectiveness in implementing the Principles
Possible actions	Support/participate in networks and information platforms to share tools, pool resources, and make use of investor reporting as a source of learning Collectively address relevant emerging issues Develop or support appropriate collaborative initiatives
Principle 6:	We will each report on our activities and progress toward implementing the Principles
Possible actions	Disclose how ESG issues are integrated within investment practices Disclose active ownership activities (voting, engagement, and/or policy dialogue) Disclose what is required from service providers in relation to the Principles Communicate with beneficiaries about ESG issues and the Principles Report on progress and/or achievements relating to the Principles using a comply-or-explain approach Seek to determine the impact of the Principles Make use of reporting to raise awareness among a broader group of stakeholders

Source: PRI (2020a), p. 7

integrating of ESG issues into investment decision-making and support their signatories receiving feedback and providing them with tools for improvement.

These activities will be continued and expanded. In 2017, under the headline *A blueprint for responsible investment* (PRI 2017), the PRI published three areas of impact of the next ten years:

1. The SAM module applies to investors who outsource some or all of their investment activities to external investment managers.
2. The asset class modules only apply when a signatory has 10% or more of their AUM invested directly in that asset class; or directly invests less than 10% but US\$10bn or more of their AUM in any particular asset class.

UN Principles for Responsible Investments (PRI), Fig. 2 PRI reporting framework for service providers. (Sources: PRI 2021h)

1. Responsible investors: “We will strengthen, deepen and expand our core work: to lead responsible investors in their pursuit of long-term value and to enhance alignment throughout the investment chain.”
 - Empower asset owners
 - Support investors incorporating ESG issues
 - Foster a community of active owners
 - Showcase leadership and increase accountability
 - Convene and educate responsible investors” (PRI 2017, p. 5)
2. Sustainable markets: “We will address unsustainable aspects of the markets that investors operate in, to achieve the economically efficient, sustainable global financial system that responsible investors and beneficiaries need.”
 - Challenge barriers to a sustainable financial system
 - Drive meaningful data throughout markets” (PRI 2017, p. 5)
3. A prosperous world for all: “We will enable signatories to improve the real world – now and in the future – by encouraging investments that contribute to prosperous and inclusive societies for current and future generations.”
 - Champion climate action
 - Enable real world impact aligned with the SDGs” (PRI 2017, p. 5)

Creating a sustainable financial system is necessary as the investment community has a huge impact on shaping the economy. Therefore, the question is still up to date how PRI’s signatories as important investment community can contribute with their investment activities to sustainability outcomes in the real world (PRI 2021i, p. 5). PRI-led net-zero initiatives are one necessary step to tackle climate change (PRI 2021i, p. 27).

Ethical education; UNPRME, Responsible education

Definition/Description

The Principles for Responsible Management Education (PRME), a 2007 project funded by the United Nations, aims to increase awareness of sustainability in educational settings worldwide and give today’s business students the knowledge and skills they need to effect change in the future.

Principle 1. Purpose: “We will develop the capabilities of students to be future generators of sustainable value for business and society at large and to work for an inclusive and sustainable global economy.”

Principle 2. Values: “We will incorporate into our academic activities and curricula the values of global social responsibility as portrayed in international initiatives such as the United Nations Global Compact.”

Principle 3. Method: “We will create educational frameworks, materials, processes and environments that enable effective learning experiences for responsible leadership.”

Principle 4. Research: “We will engage in conceptual and empirical research that advances our understanding about the role, dynamics, and impact of corporations in the creation of sustainable social, environmental and economic value.”

Principle 5. Partnership: “We will interact with managers of business corporations to extend our knowledge of their challenges in meeting social and environmental responsibilities and to explore jointly effective approaches to meeting these challenges.”

Principle 6. Dialog: “We will facilitate and support dialog and debate among educators, business, government, consumers, media, civil society organizations and other interested groups and stakeholders on critical issues related to global social responsibility and sustainability.”

Context

As a result of an increasing number of corporate scandals, malpractice, and economic mismanagement that contributed to a worldwide financial crisis, attention has been focused not just on the business community but also on the business schools’ responsibility for training many of the senior executives (see, e.g., Brooks 2009; Global Foundation for Management Education 2010). Business schools are criticized by Pfeffer and Fong (2004) for organizing management education around a value proposition that emphasizes components that will boost careers and pay. The aim for business and management schools to be seen as “scientific,” according to Ghoshal (2005), has led to an overreliance on a limited core theoretical agenda that has ignored ethics and morals.

An increased focus on morality, social responsibility, business ethics, and sustainability is at the forefront of this evaluation of management education, reflecting societal concern with excessive materialism, a lack of corporate accountability, and the contribution of business to environmental deterioration and human rights violations (Blowfield and Murray 2011; Burchell 2008). Following a suggestion made by academic

stakeholders of the UNGC, a platform for global involvement based on principles has been created for academic institutions. The concept was first launched by the UNGC at the Case Western Reserve University Global Forum “Business as an Agent of World Benefit” in October 2006.

History

The Principles for Responsible Management Education (PRME), a 2007 project funded by the UN, aims to increase awareness of sustainability in educational settings worldwide and give today’s business students the knowledge and skills they need to effect change in the future. An international work committee comprising 60 deans, university presidents, and authorized representatives of top business schools and academic institutions created PRME. Co-conveners in the drafting process who later endorsed the final document were:

- AACSB International
- European Foundation for Management Development (EFMD)
- Aspen Institute Business and Society Program
- European Academy of Business in Society (EABIS – now ABIS)
- Globally Responsible Leadership Initiative (GRLI)
- Net Impact

PRME was launched in 2007 by UN Secretary-General Ban Ki-moon at the UN Global Compact Leaders’ Summit in Geneva and has grown to be the largest formal organization between the UN and business schools.

In addition to raising awareness of the Sustainable Development Goals (SDGs) and fostering the development of tomorrow’s ethical corporate leaders, PRME’s objective is to revolutionize business and management education, research, and thought leadership globally. Over 850 higher education institutions with a focus on business and management are part of the effort, which spans 96 nations. A Board made up of professionals from industry and academics oversees PRME and the UN Global Compact (UNGC).

The PRME task group created a set of six guiding principles [purpose, values, method, research, partnership, and dialogue] that serve as the cornerstone of the global platform for responsible management education, coordinated by the UNGC and top academic institutions.

Principle 1. Purpose: “We will develop the capabilities of students to be future generators of sustainable value for business and society at large and to work for an inclusive and sustainable global economy.”

Principle 2. Values: “We will incorporate into our academic activities and curricula the values of global social responsibility as portrayed in international initiatives such as the United Nations Global Compact.”

Principle 3. Method: “We will create educational frameworks, materials, processes and environments that enable effective learning experiences for responsible leadership.”

Principle 4. Research: “We will engage in conceptual and empirical research that advances our understanding about the role, dynamics, and impact of corporations in the creation of sustainable social, environmental and economic value.”

Principle 5. Partnership: “We will interact with managers of business corporations to extend our knowledge of their challenges in meeting social and environmental responsibilities and to explore jointly effective approaches to meeting these challenges.”

Principle 6. Dialog: “We will facilitate and support dialog and debate among educators, business, government, consumers, media, civil society organizations and other interested groups and stakeholders on critical issues related to global social responsibility and sustainability.”

PRME has developed as a network serving as a platform for idea exchange and facilitating learning among the signatories through a variety of channels, in addition to providing a framework for implementing responsible management education. This network is divided into 14 Regional

Chapters with their own governance. There are eight working groups composed of faculty, industry experts, business leaders, and student collaborators who produce research on specific issues and their implications for responsible management education. There are also PRME champions composed of a select group of high-performing institutions that serve as case studies on how the signatories can transform their business education curricula and research around the Six Principles.

The PRME program sets guidelines for business and management schools to follow and offers a space for information sharing and learning, much to the UNGC, which anticipates signatory businesses to adhere to ten principles of responsible business. The effort places a strong emphasis on transparency via recurring Sharing Information on Progress (SIP) reports as well as ongoing progress along six (plus one) criteria.

Signatories

The PRME program was introduced before the global financial crisis. To become a PRME signatory, the institution is required to state its commitment to the six principles and to report on progress in applying them every 18 months. Otherwise, the institution will be delisted as a signatory.

Although enrollment in schools was modest at first, it has significantly increased over the past 5 years (particularly in the United Kingdom). Only nine UK institutions signed in May 2008. In contrast, by March 2012, 40 universities have expressed support, including nine of the top 20 UK business schools according to the Financial Times. By March 2014, 540 groups from around the world were taking part in the campaign. The participation of the Association of MBAs (AMBA), the Association to Advance Collegiate Schools of Business (AACSB), the European Foundation for Management Development (EFMD), and the Association of Business Schools (ABS) on the PRME Steering Committee has been equally significant in PRME's growing credibility.

Despite the initiative's worldwide nature and the PRME signatories' global reach, most of the initiative's first signatories, which include some of the world's greatest economies, were from Western Europe (33%) and North American (22%). However, the geographical distribution of signatories is now a little wider. The majority of PRME signatories outside of these prominent regions are found in Latin America (13%), Asia, Australia, and New Zealand (16%). Around 10% of PRME signatories are from Eastern Europe and the CIS combined. Africa's percentage of signatories has climbed from 3% to 7%.

There are currently 510 signatories from 81 different nations to the PRME effort. From 2008, when PRME received 195 members, this constituted a consistent growth rate, with an average of roughly 80 new signatories joining every succeeding year, with 2012 being the most astounding year of growth. However, the total number of PRME signatories leveled out to a little above 500 in 2013, when signatories who failed to submit a SIP were delisted according to the policy.

From among the 2022 QS World University Ranking on Business and Management Top Schools and Programs, only HEC Paris School of Management (10th) joined in 2020 and Copenhagen Business School (14th) joined in 2008.

For Bloomberg Top 10 Business Schools in 2022–2023, none from the USA is a signatory while in Europe, those who signed are IESE Business School (3rd) and ESADE (10th) both in 2008, University of St. Gallen (6th) in 2010, and University of Mannheim (7th) in 2014. In Canada, HEC Montreal (2nd) joined in 2023, Smith, Queen's University (4th) joined in 2008, and Desautels, McGill University (5th) joined in 2017. Finally, in the Asia-Pacific Region, China Europe International Business School (3rd) joined in 2008, while Shanghai University MBA Center (7th) joined in 2009.

Of the top 20 Business schools in 2023 ranked by CEOWORLD Magazine, only Haas School of Business, UC Berkeley (9th) joined in 2012, Alliance Manchester Business School (14th) joined in 2019, and UCLA Anderson School of Management (17th) joined in 2021.

Sharing Information on Progress (SIP) Report

Even as a “soft voluntary regulation,” signing up for PRME comes with some obligations. The PRME 2010 initiative mandates institutions to routinely share information about their work in progress; otherwise, they will be removed as signatories. Active participation in the UN PRME program by signatory institutions includes reporting on success to other business schools and others. The SIP reports serve two purposes (UN PRME 2012): first, they offer the PRME network a significant learning opportunity by facilitating the exchange of experiences and best practices; second, they give all stakeholders a regular update on the accomplishments made by the signatories (at least every 24 months, although yearly communication is encouraged).

The Inspirational Guide (PRME 2012) specifically strives to give instances of good practice, while the SIP reporting studies provide overviews of these developing areas. To assist PRME signatories in integrating responsible management education and research and to enable individual contextualization, the 6 + 1 principles and the specifications for SIP reports are both formulated widely (Waddock et al. 2011). Principles and SIP reports are related in that many signatories use them to organize their SIP reports and convey the successes and difficulties of putting the principles into practice as well as plans.

To encourage reporting, reports are recognized by SIP Excellence Awards on two criteria:

- Quality of reporting (not the quality of what is reported).
- How the signatory shares information on progress in relation to PRME.

Even if the focus of the report is the signatory's progress in relation to PRME, the signatory may include other initiatives not related to PRME.

The signatories reported some initiatives made to enhance corporate social responsibility and business ethics education (Matten and Moon 2005; Moon and Orlitzky 2011; Orlitzky and

Moon 2010) such as the conduct of curriculum review by Euclid University and the stakeholder dialogue series of the Lorange Institute of Business Zurich. The self-presentations demonstrate commitment to greening the campus and other initiatives that help preserve the environment, reduce emissions (with a particular emphasis on carbon emissions), and improve resource management. A specific initiative is University of Bologna's enhancement of the territory through the preservation and renovation of natural resources and the more strategic Edith Cowan University Climate Initiative Task Force in Western Australia. Increased attention has been focused to organizational transformation and how individual institutions facilitate organizational learning and change toward more excellent adaption of PRME (Godemann et al. 2011; PRME 2012). Specific initiatives involved institutionalization of PRME in the school's vision and mission (George Mason School of Business, USA) or in the quality management system in the form of a PRME Booklet which every staff signed at the end as a form of a pledge (Richfield Graduate Institute of Technology (Pty) Ltd., South Africa). There are also emerging links between schools and stakeholder engagement standards, such as the AccountAbility 1000 series (Godemann et al. 2011), and reporting standards, such as the Global Reporting Initiative guidance document (PRME 2012). Overall, participating in the PRME initiative is believed to enhance the formalization and development of strategic integration of social responsibility and sustainability (Godemann et al. 2011; PRME 2012). For instance, the Hanken School of Economics in Finland conducted the Sustainable Development Goals week and the 2-month Sustainability-In-Action Challenge.

Critique

Rethinking management and leadership education is still a struggle (GRLI 2012). The stakeholders have regularly singled out management education

as having a special duty in the larger agenda for social, economic, and ecological sustainability due to the crucial role it plays (e.g., as one of the key sources of recruiting for the financial industry) (e.g., Khurana 2010; Khurana and Nohria 2008). In this regard, PRME has been referred to as the crucial catalyst for management education's transformation and for the adjustments needed to satisfy the growing public demands for a responsible economy (Waddock et al. 2011; Rasche and Kell 2010; Haertle 2012).

Contrary to its claim of catalyzing transformative management education, some scholars argue that PRME does not encourage critical thinking (Louw 2015). PRME's underlying assumption is that management is an agent of the shareholders (Khurana 2010). This utilitarian view of business education precludes critical thinking about modern capitalism and the attendant results (Zald 2002). This is problematic because PRME positions business schools as servants that tailor management education according to the fit of the corporate sector (Louw 2015). The interest of business holds the universities hostage (Giroux 2011, p. 150) such that business schools have lost their moral and professional ideals as in the case in the USA (Khurana 2010). Instead of higher education contributing to culture and society, higher education focused on the economic and entrepreneurial (Collini 2012). Principle 1 of PRME which purports to develop the capabilities of students to generate value toward an inclusive and sustainable global economy reveals the utilitarian view of business education. If PRME is truly a catalyst for transformative management education, its orientation should be to educate about management and not for management (Watson 2001). In fact, in 2022–2023, most of the top business schools in the USA, UK, and Asia-Pacific that are thought leaders in their right are not signatories to PRME.

This "stakeholder-orientated" view is further reinforced in Principle 3. Instead of a call to discovery and insight on business education, PRME method is to create "educational frameworks, materials, processes and environments that enable

effective learning experiences for responsible leadership.” There is no appreciable difference in the business curriculum development between signatory and nonsignatory business schools in the UK where responsible management issues had not been mainstreamed or thoroughly covered like other core management subjects (Burchell et al. 2015).

In the 2012 Rio + 20 declaration of PRME, endorsed by the participants of the Third Global Forum for Responsible Management Education “The Future We Want: A Roadmap for Management Education to 2020,” interest was expressed in giving “purpose to research so that it supports organizations to serve the common good” (PRME 2012). However, a reading of Principle 4 makes clear that research will be for the purpose of understanding the role, dynamics, and impact of corporations. Knowledge sought is about the challenges of business corporations in meeting social and environmental challenges, and exploration is limited to jointly effective approaches to meeting the corporation’s challenges. This is discriminatory as it appears to have minimized other stakeholders’ role, dynamics, and impact in the business education ecosystem toward creating sustainable social, environmental, and economic value. This is more emphatically seen in Principle 5 which limits the partnership and interaction in extending knowledge only with managers of business corporations. The interaction with the other stakeholders identified to be the educators, government, consumers, media, civil society organizations, and other interested groups is limited in Principle 6 to the facilitation and support of dialog and debate on critical issues about global social responsibility and sustainability (Louw 2015).

Notably, despite Principle 5’s declaration of partnership and interaction only with managers of business corporations, signatories still report initiatives that are not only limited to managers of business corporations but also include nonbusiness entities such as the Centre of Art and Exhibitions Zurich and Climate-KIC Switzerland initiated by The Lorange Institute of Business Zurich.

Moreover, nonsignatory schools are already capable of curriculum development and engaged with the responsible management agenda without signing up for PRME (Burchell et al. 2015). Such is true in the case of the top business schools who are acknowledged thought leaders. In 2022–2023, most of the top business schools in the US, the UK, and the Asia Pacific are not signatories to PRME.

PRME affiliation may not be the catalyst for transformative management education. Rather, PRME membership may be utilized by signatories to communicate and justify activities that were already evolving (Burchell et al. 2015).

Introduction

Being part of the seven Regional Seas Conventions administered by the United Nations Environmental Programme (UNEP), the UNEP Abidjan Convention (ABC) or “Abidjan Convention” (short form for the Convention for the Cooperation in the Protection, Management and Development of the Marine and Coastal Environment of the Atlantic Coast of the West, Central and Southern Africa Region) is the only competent instrument for marine and coastal management/governance in the Southeast Atlantic region. ABC’s jurisdiction covers 22 countries, and adopted by 19 contracting State Parties as the overarching legal framework under which all marine and coastal related initiatives, programmes and activities in the region are anchored (IW: LEARN 2019). The 19 contracting State Parties

that have ratified the Abidjan Convention are Benin, Cameroon, the Republic of the Congo, Côte d'Ivoire, Gabon, Gambia, Ghana, Guinea, Liberia, Nigeria, Senegal, Sierra Leone, South Africa, and Togo. The ABC is being coordinated by UNEP’s Marine Ecosystems Branch within the Division of Environmental Policy Implementation, based at the Nairobi Headquarters (UNEP 2016). To support the functions of the Abidjan Convention Secretariat (ABS) on its mandate to guide national policy makers and resources managers on what should be done to fulfil the mission of “Protecting, conserving and developing the Abidjan Convention area and its resources for the benefit and well-being of its people”, a Regional Coordinating Unit (RCU) hosted in Abidjan, Côte d'Ivoire was established. With the instruments of office and legal mandate, the ABS through the RCU is saddled with the responsibility to implement the Convention’s action plan and additional protocols, while partnering with local, regional, and international and non-governmental organizations to deliver a coastal and marine space where good environmental status is maintained, social integrity enhanced, and economic prosperity realized.

The History

Propelled by concerns at regional and global levels about the abysmal state of the marine and coastal environment, UNEP in 1974 under its Regional Seas Programme began the process of birthing different regional legally binding frameworks to protect and conserve the marine and coastal areas by first, developing Regional Action Plans. In 1981, the West and Central Africa (WACAF) Action Plan was developed, which would eventually emerge as the ABC signed on 23 March 1981 in Abidjan, Côte d'Ivoire, and came into force on 5 August 1984. Just like the “Action Plan” and “Convention,” an associated protocol referred to as the “Protocol Concerning Co-operation in Combating Pollution in Cases of Emergency in the Western and Central African Region” was also signed in 1981 and came into effect in 1984 (IAGC 2019).

However, the time between 1992 and 2002 marked a period when activities of the ABC was ebbing away, due to myriad of difficulties such as competing priorities and lack of resources (UNEP 2017). But afterwards, particularly with the advent of the Gulf of Guinea (GoG) Large Marine Ecosystem Programme, the ABC was reitalized. Also, the fifth meeting of the Contracting Parties in 2000 marked another red-letter day for the ABC as two landmark decisions were made. First, its geographical extent was expanded to accommodate South Africa. Secondly, an agreement was reached by the Contracting Parties to amend ABC's first article to expand its jurisdiction landward covering related inland waters that are within the control of its Contracting States (IWG 2019).

To change and to improve Contrary to the saying that "*to change and improve are two different things*", not only did the ABC **changed** its name in 2008 to the "Convention for Cooperation in the Protection, Management and Development of the Main and Coastal Environment of the Atlantic Coast of the West Africa, Central and Southern Africa Region", it also **improved** by adding the "Protocol concerning Cooperation in Combating Pollution in Cass of Emergency" to its repertoire.

Mission/Objectives/Focus Areas

Protecting, conserving, and developing the Abidjan Convention area and its resources for the benefit and well-being of its people.

Structure of Governance

The apex of the ABC's organizational structure is the UNEP. UNEP directs the ABC's activities, communicate reports, and liaise with the Contracting Parties. Article 17 of the ABC obligates the ABS to convene a Conference of Parties (CoP) once every two years and when necessary, call for an extraordinary meeting at the request of at least four Contracting Parties. A very important

component of the ABC structure is the National Focal Points. These Focal Points are mandatorily senior government personnels who serve as a link between their respective countries and the UNEP and are saddled with the responsibility of reporting the state of coastal and marine environment. To support the activities of the Focal Points and to achieve coherence, an umbrella Forum for the Focal Points is also in place to foster the preparation of the detailed programme of work ahead of the CoP. There is a Regional Coordinating Unit (RCU) based in Côte d'Ivoire which function as the Secretariat and headed by the Executive Secretary appointed by UNEP. The Executive Secretary coordinates the implementation of the ABC's Action Plan and plays a leadership position at the CoP. The three Large Marine Ecosystems in the African Atlantic (Guinea, Canary, and Benguela Current) have also institutionalized their activities within the ABC's organizational structure as the Contracting Parties agreed to grant them special status as advisors to the ABC.

Activities/Major Accomplishments

Thirty four years after its adoption, the ABC has been at the forefront of ensuring sustainability in the coastal and marine environment under its jurisdiction. In 2010, under the auspice of the UNEP Programme of the Regional Seas and Action Plan, the ABC and the Convention for the Protection of the Marine Environment of the North-East Atlantic (OSPAR Convention) expressed interest to cooperate on two areas: (1) sharing of knowledge and experience between the two regions, and (2) implementing a transboundary ecosystem approach. An agreement to cooperate was officially reached in 2011 as a result of recommendations that emanated from a 2011 joint workshop between the ABC and OSPAR held in Libreville, Gabon, and a 2015 follow-up workshop held in Malabo, Equatorial Guinea, (OSPAR 2019). Courtesy of the revolutionary and proactive work of the ABC in the West, Central, and Southern Africa Region, there has also been intact cooperation between Regional

Fisheries Bodies (UNEP 2016), demonstrated by a 2012 decision of the ABC contracting Parties (World Bank 2017).

With the assistance of relevant international and regional organizations, the ABC has partnered with various regional and international organisations to develop and implement several integrated coastal, marine, environmental and climate change projects aimed at reducing and forestalling pressing challenges peculiar to the region. Among these projects is the Guinea Current Large Marine Ecosystem Project, Mami Wata project, West Africa Biodiversity and Climate Change project (WABICC), World Bank's West Africa Coastal Areas Management Programme (WACA), etc.

Recently, during the ABC's 13th COP, history was made as four additional Protocols were adopted by the Contracting Parties. These include the Calabar Protocol on Sustainable Mangrove Management; Grand-Bassam Protocol on Pollution from Land-based Sources and Activities; Malabo Protocol on Environmental Standards and Guidelines for Offshore Oil and Gas Activities; and the Pointe Noire Protocol on Integrated Coastal Zone Management (Abidjan Convention 2019). These four Protocols have been identified by experts as a game-changer towards achieving targets put forward by the Sustainable Development Goal 14, and the entire UN Agenda 2030.

Summarily, the convention provides an important instrument through which national policy makers and resource managers implement national control measures in the protection and development of the marine and coastal environment of the WACAF Region (West and Central African Region). Owing to its effective coordination and support, the Abidjan Convention Secretariat has ensured sustainable management of coastal and marine domain within the ABC jurisdiction. The ABS has matched-up ABC's evolution since 1981 by providing continuous mechanisms and programmatic initiatives which promotes transboundary cooperation, integrated management of marine resources, and innovation pathway for improving the socioeconomic status of people who depend on marine resources for their livelihood.

[UNIDO](#)

Definition/Description

The United Nations Industrial Development Organization (UNIDO) is the specialized agency of the United Nations (UN) that promotes industrial development for poverty reduction, inclusive globalization, and environmental sustainability. Created in 1966, it gained status of a UN specialized agency in 1985. Currently UNIDO has 170 member states (UN Brussels [2020](#)).

The purpose of the organization is to provide assistance to countries and communities to enhance economic development through the improvement of industrial capacity.

The mission of UNIDO, as described in the Lima Declaration adopted at the fifteenth session of the UNIDO General Conference in 2013, is to promote and accelerate inclusive and sustainable industrial development (ISID) in member states (UNIDO [2013](#)). The organization’s main focus areas are structured in four strategic priorities – creation of shared prosperity, advancing economic competitiveness, safeguarding the environment, and strengthening knowledge and institutions (UNIDO [2013](#)).

Like all organizations from the UN system, UNIDO agenda is driven by the programmatic focus of the sustainable development goals (SDGs). More specifically, UNIDO focuses its activities in the pursuit of Goal 9 which is focused on industry, innovation, and infrastructure (UNIDO [2016b](#)).

UNIDO facilitates its projects by implementing a holistic approach through combining four areas of cooperation – technical cooperation; analytical and research cooperation, and policy adoption and implementation cooperation; normative and quality-related activities; and creation of partnerships for knowledge transfer, networking, and industrial cooperation (Gall and Hobby [2007](#)).

UNIDO also functions as a facilitator of the mobilization of financial resources for the execution of relevant industrial development projects, with funding provided from governments, vertical funds, international financial institutions, etc. (UNIDO [2016a](#)).

History

Before the establishment of UNIDO, it was developing countries that have been pressing for the creation of a central UN organization for promotion of industrialization, particularly in the manufacturing sector (Campbell [1967](#)). Up to that point, UN specialized agencies had carried out activities on industrial development only as matters peripheral to their central concerns (Campbell [1967](#)).

In 1960 ECOSOC established a committee on industrial development, consisting of 18 members, that provided surveys and studies on the topic (Campbell 1967). However, in 1965 in light of the still very unsatisfactory levels of industrial development in developing countries, the UN General Assembly approved the establishment of an autonomous organization that would handle industrial development issues (Campbell 1967).

Thus, in 1966 UNIDO was formed by changing the UN Centre for Industrial Development, which was part of the UN Secretariat, into an autonomous organization of the United Nations (Kulesa 2010). In the first years of the existence of the organization, supporters of its stronger position in the UN system, which were mostly developing countries, could not achieve to be provided with UN specialized agency status. It was only after lengthy negotiations when in the Statute for UNIDO as a specialized agency was adopted on 8 April 1979 (Kulesa 2010).

For the first years of its existence UNIDO profiled itself as the United Nations entity supporting structural transformation of economies. In order to achieve its goals UNIDO initially relied on the top-down approach in industrialization, and focused on dialogue with local governments. From 1967 to 1997 UNIDO deployed senior industrial development field advisors (SIDFAs) and, later, UNIDO country directors (UCDs) (UNIDO 2016b). SIDFAs/UCDs were responsible for the industrial sector of UNDP country programs and acted as advisers to local governments on industrial matters.

After the adoption of the Lima Declaration in 1975, the organization moved on from supporting industrialization based on central planning, state-owned enterprises, and import substitution to private industries and export-led growth (UNIDO 2016b). A greater focus on South–South cooperation was established. A long process of ratifying UNIDO's establishment as a specialized agency of the United Nations is finally concluded in 1985 (Kulesa 2010).

A system of industrial consultations was established. In the context of the oil crises in the 1980s UNIDO started to assist developing countries in the realm of industrial energy efficiency and renewable energy (UNIDO 2016b).

The end of the Cold War marked a historic shift in international economic cooperation. The era of globalization and trade liberalization brought up new aspects on economic cooperation. It was in this period when development was reoriented towards aid in social sectors. The shift in development aid away from industrial cooperation towards social projects continued through the 1990s and 2000s (UNIDO 2016b). With the millennium development goals reaffirming this approach, UNIDO fell into an identity crisis, and some of the key contributor member states withdrew from the organization.

In the year 2013 UNIDO's General Conference, in its second Lima declaration, adopts the concept of inclusive and sustainable industrial development (ISID) (UNIDO 2013). Campaigns such as sustainable energy for all are launched. To facilitate the efforts of governments in implementing ISID, UNIDO launches pilot versions for its program for country partnerships (PCPs). In recent years UNIDO develops a strong South–South cooperation initiative which is mostly led by China.

Policy Review and Governance

The organization's medium-term program framework 2018–2021 has stated the four strategic priorities of UNIDO – **creating shared prosperity, advancing economic competitiveness, safeguarding the environment, and strengthening knowledge and institutions** (UNIDO 2017).

UNIDO's five basic development objectives, approved by UNIDO's fifth General Conference in December 1993, are as follows:

- Promotion of industrial and technological growth and competitiveness
- Promotion of the development of human resources for industry
- Promotion of equitable development through industrial development
- Promotion of environmentally sustainable industrial development
- Promotion of international cooperation in industrial investment and technology (Muegge and Assaf 1995)

UNIDO acts as the central coordinating agency for matters related to industrial development; a focal point for industrial technology; an honest broker for industrial cooperation; a center of excellence on industrial development issues; and a global source of industrial information (Gall and Hobby 2007).

The structure of UNIDO comprises of three main organs – the General Conference (GC), the Industrial Development Board (IDB), and the Program and Budget Committee (PBC). The GC is the structure that determines the guiding principles and policies of the organization and approves the budget and work program (UNIDO 2020a, b, c). It meets every two years. The Conference also appoints the director general and the members of the Industrial Development Board and of the Program and Budget Committee. The IDB has a four-year term, with its 53 members being chosen on a rotational basis. It meets on an annual basis and is in charge of reviewing the implementation of the working program, the regular and operational budgets, and policy recommendations to the GC (UNIDO 2020a, b, c).

The PBC is a subsidiary organ of the Board, which comprises of 27 members, and has the main purpose to provide assistance in the preparation of the work program, the budget, and other financial matters (Gall and Hobby 2007).

The UNIDO Secretariat is situated in Vienna, Austria. It maintains liaison offices in New York, Geneva, and Brussels. UNIDO maintains 30 field offices and 19 regional hubs worldwide. It also

has 9 ITPOs situated in Asia, Europe, Africa, the Middle East, and Latin America. Since 2013 the director general of UNIDO is Li Yong, a former vice-minister of the People's Republic of China Ministry of Finance (MOF) (UNIDO 2020d).

As of December 2019, UNIDO has a total of 170 member states (UNIDO 2020a, b, c). It is however one of the few UN specialized agencies from which key contributors to the UN system have withdrawn their participation. A list of membership withdrawals from UNIDO are presented in Table 1.

UNIDO Activities

In accordance with its main objectives, UNIDO develops and acquires funding for different programs related to industrial development. Its activities are mainly regional, with programs and funding directed mainly towards developing countries. UNIDO is dedicated to the achievement of the global SDGs, and the approach to handling that is its activities are often with local or regional focus. Though the typical strategic actions of UNIDO are concentrated on local initiatives, a few global initiatives in which the organization participates and facilitates also have impact on the organization's identity.

Historically, UNIDO's activities have been concentrated on developing countries in Africa, Latin America, and Asia. UNIDO has executed projects in economies in transition too – it played a role for

UNIDO: United Nations Development Organization,
Table 1 Former members of UNIDO (2020c)

Member state	Date of membership	Date of withdrawal
Australia	1985	1997
Belgium	1985	2015
Canada	1985	1993
Denmark	1985	2016
France	1985	2014

United States of America	1985	1996

the restructuring of economies in Soviet states and Eastern European countries in transition after the Cold War (Muegge and Assaf 1995). It still has regional offices in Armenia, Kyrgyzstan, etc.

UNIDO activity is concentrated within two main fields of assistance it provides:

- **Technical cooperation**

The purpose of UNIDO's technical cooperation function is to build the capacity of member states to initiate and carry out their own programs in the field of industrial development. The organization's technical cooperation activities are made to meet the needs and requirements of developing countries across UNIDO's three thematic priorities of creating shared prosperity, advancing economic competitiveness, and safeguarding the environment (UNIDO 2020b). Assistance is provided to developing countries, with special attention to least developed countries (LDCs).

Technical cooperation projects in the sphere of shared prosperity currently have both global and local projects. One global project, which UNIDO coexecutes with other UN agencies, is the UNIDO initiated joint program (3ADI) in the areas of agribusiness value chains, food security, policies, financing, and related trade (Matambalya 2015). Current local projects include assistance in industrial development, youth empowerment, sustainable business, etc. in developing countries (UNIDO 2020b).

Technical cooperation projects in the sphere of advancing economic competitiveness currently include a number of local projects in Latin America, Africa, etc. A global project in action is the trade facilitation project which offers support to UNIDO member countries in achieving effective and efficient implementation of WTO's new trade facilitation agreement (TFA) (UNIDO 2020b).

- **Investment support**

UNIDO has a key role in facilitating dialog between developing countries and investors. UNIDO has created a network of programs and cooperation frameworks for promoting investment in developing countries. Key structures such as the Investment Promotion

Services (IPSS) have played a vital role in the investment support activities of UNIDO (UNIDO 2016a). In the late 1990s the IPS network was renamed to the Network of Investment and Technology Promotion Offices (ITPOs), which would prioritize investment promotion and technology transfer in Africa, and in LDCs, in particular (UNIDO 2016a).

UNIDO's investment services may be categorized in the following main areas:

- Matchmaking between buyers and suppliers
- Mobilizing investments through targeted institutional cooperation
- Promoting technology transfer, with a focus on green technologies
- Strengthening institutional capacity of public and private partners
- Encouraging public-private partnerships
- Fostering entrepreneurship to attract more domestic and foreign investment (UNIDO 2016a)

Some of UNIDO's flagship programs and tools include the global network of Investment and Technology Promotions Offices (ITPOs), with nine such ITPOs currently working across the globe; the network of Subcontracting and Partnership Exchanges (SPXs); the UNIDO Investment Learning Centre (ILC); the Enterprise Development and Investment Promotion (EDIP) (UNIDO 2016a).

After the adoption of the Paris Declaration on Aid Effectiveness and the Accra Agenda for Action UNIDO created the Investment and Technology Promotion Branch to support the growth of industrial productivity in developing countries (UNIDO 2016a). A prominent agency in UNIDO's investment promotion actions became the Africa Investment Promotion Agency Network (AfrIPANet) (UNIDO 2016a).

UNIDO Budget and Funding

UNIDO's budget and funding is allocated to financing UNIDO projects, to executing

campaigns and industrial development programs, and to maintenance of organizational structures. The budget consists of three categories – the regular budget, the operational budget, and voluntary contributions (Gall and Hobby 2007). The regular budget is formed from regular contributions of member states. The operational budget is formed through the implementation of projects (Gall and Hobby 2007). Like other UN specialized agencies, UNIDO's funding is divided into core contributions by member states, and ear-marked contributions, ascribed to particular goals and projects of the organization.

After the United Nations Conference on Environment and Development (Rio conference) in 1992, the new Global Environment Facility (GEF) becomes a major funding mechanism for environment-related activities. UNIDO became an implementing agency for both the multilateral fund and the GEF, which become substantial donors for activities covering industry, the environment, and sustainable energy. Bilateral donors start to play an increasingly important role in the funding of technical cooperation projects. In December 2019 UNIDO secured funding by GEF for over US\$38m of GEF funding for its submitted proposals. UNIDO's GEF funding highlights the organization's commitment to support its member states in their efforts to tackle some of the most pressing environmental challenges (UNIDO 2020a). UNIDO is also closely related with the UNDP when it comes to facilitating and executing projects in different spheres (Gall and Hobby 2007).

UNIDO and the Sustainable Development Goals (SDGs)

Like all organizations from the United Nations system, UNIDO agenda is driven by the programmatic focus of the sustainable development goals (SDGs). More specifically, UNIDO focuses its activities in the pursuit of Goal 9 which calls to "Build resilient infrastructure, promote inclusive and sustainable industrialization and foster innovation" (UN 2015) and is oriented towards the

development of quality regional and transborder infrastructure, the promotion of inclusive and sustainable industrialization and raising industry's share of employment and gross domestic product, the increase in access of small-scale industrial and other enterprises to financial services, including affordable credit, and their integration into value chains and markets, and enhancing scientific research and upgrading of technological capabilities of industrial sectors in all countries with a focus on developing countries.

The relevance of UNIDO's ISID concept, however, applies in greater or lesser extent to all SDGs. All UNIDO projects and programs are to a large extent related to the eighth SDG goal which focuses on promoting decent work and an economic growth. Some UNIDO programs are directly related to other SDG goals. One example is the empowering youth for change program in Cote d'Ivoire which is also related to the fourth SDG which focuses on quality education. Other UNIDO programs have adhered to SDGs regarding gender equality, with training and inclusion in economic life of women and at-risk youth in LDCs and developing countries (UNIDO 2016b).

Criticism of UNIDO

UNIDO has faced criticism since the beginning of its existence. It was in the first place the overall unwillingness of key actors in the UN system to create such an organization that is fairly noticeable. In retrospective, UNIDO is the only UN specialized agency that has been given the status of a specialized agency somewhat at odds with some members of the UN. While largely favored by developing countries, and a mostly a product of their political efforts at the UN (Campbell 1967), it would seem that members from developed countries did not seem to think that a structure specializing in industrial development is needed. Rather, it is still a widely adopted critique that UNIDO's activities are duplicating the activities of other UN agencies such as the UNDP.

UNIDO has received criticism about lacking transparency as well (Beigbeder 1997), which has been an issue that all UN agencies have been working on overcoming.

Summary

United Nations Industrial Development Organization (UNIDO) gains its specialized agency status in 1985, 19 years after its creation. Its role of an organization for industrial development sets the path for cooperation between states in the field of industry and technology, where traditionally competition is king. For this reason, UNIDO's road has sometimes been rocky, but in the year's organizational evolution, the agency has established an organizational path for cooperation between countries.

The role of UNIDO, although contested by some members of the United Nations, remains a key organization for facilitating development projects. The industrial development promotion has changed its means of achievement through time and has come to its present form through a number of reorganizations. The current project and investment-oriented approach the organization uses is proving to be a market-oriented approach to connecting investors with developing economies, and it has a significant impact on the promotion of dialog and coordination between business and emerging markets.

[Sustainable development goals](#)

Definition

The increasing attention paid by stakeholders to socioenvironmental themes has imposed

policymakers to identify new economic paradigms. Starting from the Brundtland Report, national and over-national organizations have started to introduce new forms of regulation in order to favor the achievement of higher degree of worldwide well-being (Schubert and Láng 2005).

Nowadays, one of the main initiatives about sustainable development is represented by the introduction of the Agenda 2030 by the United Nations. The Agenda 2030 has been introduced on 25 October 2015 after a deep consultation about the opportunity to introduce a new agreement about the main topic of sustainable development.

The central role covered by Agenda 2030 is confirmed from Member States reaction to its introduction. In fact, it has been signed from all the 169 states involved in the United Nations. In this sense, the Agenda 2030 represents the first attempt to achieve highest level of sustainability through a set of common targets for all the Member States. Furthermore, the United Nations explicitly required in Sustainable Development Goals (SDGs) active participation from private and public sectors.

The contents of the Agenda 2030 are characterized by a high degree of heterogeneity related to the high number of topics connected to the concept of “sustainable development.” On this point, for the United Nations, the Agenda 2030 represents “*a plan of action for people, planet and prosperity*” to eradicate the worldwide poverty (United Nations 2015). According to this evidence, Agenda 2030 provided a set of 17 SDGs divided into 169 targets that represent standalone topics.

The Agenda 2030

The Agenda 2030’s introduction has been favored from the increasing consciousness about the negative externalities related to an “unsustainable world.” Furthermore, the data provided by World Economic Forum (2019) revealed how the introduction of Agenda 2030

following a period characterized from an increased probability of adverse events related to climate change, economic inequality, and societal well-being.

The Agenda is composed of 17 goals that represent different items related to the macro-concept of sustainable development that ideally followed the previous Millennium Development Goals (MDGs) (Pineda-Escobar 2019). However, despite the common origin, SDGs and MDGs are characterized by several differences. Specifically, the main differences are represented by number of goals, stakeholders interested, and role of civil society (Kumar et al. 2016). Furthermore, SDGs has been defined through several consultations with stakeholders while MGS was defined only from the United Nations. According to this evidence, the contents of Agenda 2030 are characterized by increasing attention paid from policymakers both from a qualitative perspective and from a quantitative one to sustainable development themes.

The preliminary evidence collected about the SDGs achievement reveals how they are interrelated despite their independency (Nerini et al. 2019). However, as evidenced before the achievement of SDGs needs an effective contribution both from Member States and from private sector. The private sector contribution represents a criticism for SDGs' achievement. In fact, Member States contribution to SDGs is connected to their social role covered in the society, while the contribution of private firms is related to their orientation toward socially responsible themes.

The achievement of the targets identified within Agenda 2030 needs effective support from private firms in order to increase worldwide equality. In fact, the documents required an active contribution to SDGs both from public and both from private sector. The implementation of these practices from them has been characterized by different responses. Specifically, only a small part of MNE has introduced in their business models explicitly references to them. However, this criticism was just considered in Agenda 2030 through an explicit provision for Member

States to “*Encourage companies, especially large and transnational companies, to adopt sustainable practices and to integrate sustainability information into their reporting cycle*” in SDG 12.6.

The preliminary evidence about private sectors orientation toward SDGs reveals how they are influenced by internal and external factors. This evidence followed as evidenced from overnational institution that highlights how “walking” and “talking” about SDGs are two different standalone concepts (Mhlanga et al. 2018). The internal factors related to SDG's orientation is connected to firms' characteristics, while the external factors are related to the context where they operate (Rosati and Faria 2019a, b). Furthermore, their approach is typically characterized by the prioritization of SDGs (Ike et al. 2019).

Summary

Agenda 2030 represents a tool to achieve a more high degree of worldwide sustainable development. The role covered by Agenda 2030 will be determinants for the future generation due to its innovative contents. Furthermore, the call in action of new categories of stakeholders not related to institutional entities represents the first attempt to increase the attention to these new topics. In fact, one of the major element of novelty of SDGs is represented by the involvement of the private sector.

Nowadays, the worldwide scenario has been characterized by progress in terms of SDGs' achievement. However, the full achievement of these ambitious goals needs the highest degree of contribution from the private entities. In this sense, a central role will be covered by academics in order to increase the overall knowledge about these themes.

Introduction

Climate change has become one of the defining environmental challenges of this generation and indeed the world is now at a crossroad. While there has been increasing shifts in the pattern of climate; threatening global food security, rising sea levels have increased the flooding risks and the scale and significance of the global impacts of the changing climate is unprecedented. Without drastic and timely collective action to reverse the present trend, adaptation to future impacts of climate change may prove arduous and expensive (Ott et al. 2004). However, even though greenhouse gases (GHGs) are naturally occurring and are critical to the survival of humans and other species, scientific evidences have linked the

increasing variation in the pattern of climate to the steady rise in concentration of GHGs in the Earth's atmosphere with carbon dioxide (CO₂) accounting for about two-third of the GHG emission. This global situation is occasioned by over a century and a half of industrial production and massive deforestation activities (Matemilola et al. 2019). The depth and breadth of knowledge and understanding of climate change causes and implications have grown tremendously over the last few decades and it is the clarity of understanding that has motivated the call for collective action at international, regional, national, and local levels. Thus, the conception of the most fundamental international climate agreement, the United Nations Framework Convention on Climate Change (UNFCCC) at the Earth Summit in Rio de Janeiro 1992 with the goal of stabilizing the concentration of GHGs in the Earth's atmosphere at a level where human interference will not cause significant threat to the climate system (Montes 2013; UNFCCC 2006).

History

Scientific proof of the anthropogenic interference with the climate system was first presented at the World Climate Conference in 1979. The conference called for national governments to anticipate and prevent worse climate effects. This event triggered wide range public awareness of global environmental challenges in the 1980s and governments became more concerned about global climate issues. This led to the establishment of the World Climate Program led by the World Meteorological Organization (WMO) in collaboration with the United Nations Environment Program (UNEP) and the International Council of Scientific Unions (ICSU) (UNFCCC 2007). In 1988, 340 delegates from 46 nations participated in the Toronto Conference on the Changing Atmosphere which further heightened the public discussion and recommended the development of a global framework convention on the protection of the climate (UNFCCC 2019a).

Later in 1988, following a proposal by the Government of Malta, the United Nations General Assembly adopted resolution 43/53 which affirms that “climate change is a common concern of mankind, since climate is an essential condition which sustains life on Earth” and pushes for the protection of the global climate for the benefit of present and future generations (Montes 2013; UNFCCC 2019b). Thus, also in 1988, the WMO and UNEP established a new body, the Intergovernmental Panel on Climate Change (IPCC), to regularly conduct studies to assess the pattern of changes, project potential impacts and significance, and response strategies. The IPCC published its First Assessment Report on the state of the global climate in 1990. The IPCC Annual Assessment Report have since formed the basis for negotiations at the UN General Assemblies on climate issues (UNFCCC 2019a).

Later in November 1990, the Second World Climate Conference was again held in Geneva, but unlike the First Climate Conference, delegates included scientists and ministers. This time the Conference called for the establishment of a treaty to deal with climate challenges and the General Assembly acted swiftly in passing Resolution 45/212 to set up the Intergovernmental Negotiating Committee (INC) for a Framework Convention on Climate Change to formally oversee negotiations on a convention on climate change at the General Assembly. The INC convened five times between February 1991 and May 1992 for negotiations and came up with a final text for the United Nations Framework Convention on Climate Change (UNFCCC) in time for adoption in May 1992 in New York (UNFCCC 2019a).

The document for UNFCCC became open for signature later in June 1992 at the Earth Summit in Rio de Janeiro, where 154 states signed it, and the convention was entered into force on March 21, 1994, after the fiftieth member State deposited its ratification instrument (UNFCCC 2007). As of 2015, the Convention already enjoys almost a complete universal membership with 197 parties, making it one of the most globally accepted International Environmental Agreements. Since it entered into force, the INC's assignment of

negotiating implementation of the UNFCCC was completed and the Conference of the Parties (COP) to the Convention became the decision body with the first session (COP 1) held in Berlin in 1995. States that are parties to the convention have since then held annual meetings of the Conference of Parties (with the most recent, COP 25 held in Madrid in December 2019) to discuss and monitor implementation of previous conventions and facilitate further negotiations on the best ways to address climate change, going forward (UNFCCC 2019b; Hermwille et al. 2015).

UNFCCC is the parent treaty for the Kyoto Protocol which was adopted on 11 December 1997 in Kyoto, Japan, and entered into force on 16 February 2005, as well as the Paris Climate Change Agreement, adopted on 12 December 2015 and entered into force on 4 November 2016. The UNFCCC in itself is not a legally binding treaty because it has no enforcement mechanism and sets no GHG emission limits. Rather, it provides platform for negotiating other international agreements (such as the Kyoto Protocol and Paris Agreement) that may be binding on parties (Ministry of the Environment and Statistics Finland 2009).

Objectives and Principles

The ultimate objective of the UNFCCC as contained in Article 2 of the Convention is “to achieve, in accordance with the relevant provisions of the Convention, stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic [originating in human activity] interference with the climate system.” This objective reflects the Convention’s concern of the threat to the Earth’s climate system from the surging anthropogenic GHG emissions. Thus, in this context, parties to the Convention further assent in the Article 2 not only to avert dangerous interference of human activities in the climate system but also to stabilize the concentration of GHG in the atmosphere in order to allow the “ecosystems to adapt naturally to climate change, to ensure that food production is not threatened and to enable economic

development to proceed in a sustainable manner” (Ministry of the Environment and Statistics Finland 2009; UNFCCC 2007).

The principles are designed to guide the actions of parties to the convention and are outlined in Article 3 of the Convention. The Article however also stresses that the list principles provided do not represent an exhaustive one. For example, the first principles, which is a replica of the Principle 7 of the Rio Declaration on Environment, stresses the principles of equity and of common but differentiated responsibilities and respective capabilities (CBDR-RC). This principle implies that although every state must take part in the climate action, the level of contribution will be based on their respective volume of emission and capabilities (Ministry of the Environment and Statistics Finland 2009).

Institutional Structure and Governance

Several bodies and groups are involved in the organizational and governance process of the Convention. These include bodies and offices set-up by the Convention such as the Conference of the Parties (COP), the subsidiary bodies (SBs), COP Presidency, and the Bureau. Also included are other working groups, committees, and bodies of expert set up by COP in line with Article 7.2(i) of the Convention (UNFCCC 2007).

Also known as the climate summit, climate change conference, or UN climate conference, the Conference of the Parties (COP) is the chief decision-making body of the Convention and this is expressly affirmed in Article 7.2. The global climate action process generally corresponds to the outcomes of the annual COP sessions where state parties to the Convention come together to deliberate on implementation of the convention and facilitate important decisions relating to climate action. Thus, at the end of a COP session, parties may adopt amendments to the convention or come up with independent agreements like the Paris Agreement. Overall, COP is responsible to review parties’ commitments, facilitate information exchange, evaluate implementation of the

Convention, review, adopt and publish reports, and make recommendations (UNFCCC 2007).

In addition, to serve as advisory institutions to the COP, the Convention established two permanent multidisciplinary subsidiary bodies (SBs), the Subsidiary Body for Scientific and Technological Advice (SBSTA) and the Subsidiary Body for Implementation (SBI), by Article 9 and 10, respectively. The SBSTA and SBI are the key working groups of the Convention and hold biannual meetings in mid-year and in conjunction with COP towards the end of the year. The SBs normally is comprised of experts from different fields because of the more technical nature of their responsibilities. The SBs play an important role in helping COP to reach key decisions with the submission of their recommendation for draft decision which COP then reviews for adoption (UNFCCC 2007).

Of key importance is the office of the COP President, which is usually rotated amongst the five UN regional groups of Africa (54 members), Asia (53), Latin America and the Caribbean (33), Western Europe and Others (WEO, 29), and Eastern Europe (23). The COP Presidency is an elective position which is open to the environment minister of party states to the Convention and normally filled upon the commencement of a COP session. The COP President must remain impartial in facilitating agreements among parties. There is also the COP Bureau which usually comprise of 11 members: the COP President, seven Vice-Presidents, the Chairs of the two SBs and a Rapporteur. While the President presides over negotiations on open issues under discussion with parties usually at ministerial level, the Vice-Presidents typically oversee high-level discussion segments. The Rapporteur however prepares report for the session (UNFCCC 2007).

Summary

Climate change is one of the most important environmental issues in recent years which has been linked to the increasing concentration of GHG in the atmosphere. United Nations Framework Convention on Climate Change was therefore

conceived as an international treaty in 1992 to provide a platform for the states to collaborate and negotiate solutions to stabilize atmospheric GHG concentration. UNFCCC has no enforcement mechanism and is not a legally binding treaty; instead, it provides the platform for other binding agreements on climate change to be negotiated. Thus, it is upon the foundation of the UNFCCC that the Kyoto protocol in 1997 and the Paris Agreement in 2015 were adopted amongst other international climate agreements.

Definition/Description

The United Nations Development Programme (UNDP) is the main United Nations (UN) agency for development. It is a part of the United Nations system of organizations, agencies, funds, and programs. Its main objective is to foster the building of “inclusive, sustainable and resilient societies” (UNDP 2019a).

Created in 1965, the UNDP currently has 176 members – both countries and territories. UNDP provides expert advice, training, and financial support (Gall and Hobby 2007, p. 141). The agency puts a special focus on sustainable development in the Least Developed Countries (LDCs) and countries emerging from conflict (UNDP 2019a).

The UNDP is a key international organization for meeting the needs of developing societies, and raising funds for the execution of development

projects all around the world (Gall and Hobby 2007, p. 144).

Its focus is on working with developing countries to find solutions to the challenges of a number of key areas of development, such as democratic governance, poverty reduction, crisis prevention and recovery, environment and energy, HIV/AIDS.

UNDP coordinates global and national campaigns that are dedicated to achieve the UN Sustainable Development Goals (SDGs). The program has over 4000 projects that operate in more than 170 countries and territories (UNDP 2019a).

The main job of the organization is to gather funding for the projects. Through its channels for fundraising, UNDP is one of the most prominent organizations in international fundraising for development (Klingebiel and Hildebrand 2010a).

History

Established with Resolution of the UN General Assembly 2029 (XX) (1965) from 22 November 1965 (UN Doc. A/RES/2029 (XX) 1965), UNDP is an organization that came to existence in 1966 from the merger of two other United Nations agencies – the Expanded Programme of Technical Assistance (EPTA), on one hand, and the UN Special Fund (SF), on other hand (Klingebiel and Hildebrand 2010a).

The organization was created in order to reduce duplication and channel financial resources toward a single legal entity. Further reforms in the UN structure have had a similar aim, with more recent reforms in the UN system having brought a clearer allocation of rights and duties to the UNDP (Klingebiel and Hildebrand 2010a).

In the context of decolonization and the rapid emergence of new countries, a lot of which came into existence after conflicts, UNDP was a much needed structure whose role for advancing the UN vision was crucial. Old problems as famine and natural disaster, and new problems as weak governments, corruption, and institutional inefficiencies were impeding development, and UNDP was the structure that was designated to facilitate the

United Nations' assistance in local and international development promotion efforts.

The first couple of projects that the UNDP developed were regional. In 1967, the UNDP partnered with the UN Food and Agriculture Organization and 42 countries to conquer desert locusts, which ravaged crops and was exposing local people to famine. In the 1960s the UNDP started a partnership with the Republic of Singapore (UNDP 2016), which had just acquired its independence as a city-state offering funding and technical expertise in such areas as education, industrialization, job creation, and urban planning. The partnership between UNDP and Singapore grew and, in 2012, the country became home for the jointly-directed Global Centre for Public Service Excellence (GCPSE), which was one of six UNDP Global Policy Centres and it operated until 2018 (UNDP 2019c).

The first global project of the UNDP was launched in 1970, and it was named "Global One" (UNDP 2016). The aim of the project was to develop a high-protein maize at an agricultural research centre in Mexico. Over time, the project has developed dozens of successful new varieties. Hundreds of people from dozens of countries have received training in maize improvement. The International Maize and Wheat Improvement Centre continues to function today and provides maize and wheat research, genetic research, as well as socioeconomic research related to sustainable development (CIMMYT 2020).

Over time, the UNDP has administered different projects with developing countries. In the 1980s the UNDP put a significant focus on gender issues by launching the Women in Development Division, and by starting a partnership with United Nations Development Fund for Women (UNIFEM). More funding was moved to women's rights projects around the world. An early grantee was Dr. Wangari Maathai, founder of the Green Belt Movement and the 2004 Nobel Peace Prize laureate. Women's rights and development has been one of the core spheres of action of the UNDP ever since (UNDP 2016).

After the end of the Cold War, the UNDP also took part in helping former Soviet countries in restoring their economies from the economic

crises and transfers from centrally planned to market economies that hit the post-Soviet countries. Such a project was the Beautiful Bulgaria project which went on from 1998 to 2011 (UNDP 2020b). The project was later extended to other former communist countries such as Armenia, Romania, and Serbia.

Currently, under the UNDP cap more than 4000 projects are being executed, with the funding in 2017 peaking to five billion dollars (UNDP 2019a).

The UNDP's Role in the UN System

UNDP is the main specialised organization of the UN for pursuing development. Following the main principles of the UN, it executes various projects and programs that aim to aid countries improve development within their societies.

The organization has outlined three main areas on which it focuses its actions:

- Sustainable development
- Democratic governance and peacebuilding
- Climate and disaster resilience (UNDP 2019c)

UNDP's main principles are in line with its three core goals – eradicating poverty, structural transformations, and building resilience (UNDP 2017). In the fulfilment of these goals, it has pointed out six signature solutions, namely:

- Keeping people out of poverty
- Promotion of governance for peaceful, just, and inclusive societies
- Crisis prevention and increased resilience
- Advancement of nature-based solutions for development
- Investment in clean, affordable energy
- Promoting women's empowerment and gender equality (UNDP 2017).

Each solution comprises of a mix of policy advice, technical assistance and financial aid (UNDP 2017).

UNDP is related to the UN General assembly (GA) and the Economic and Social Council

(ECOSOC). The monitoring of UNDP programs and projects is performed in accordance with the rules of the organization, and include both financial monitoring and performance and success monitoring (UNDP 2021).

UNDP Funding

UNDP funding is executed through a number of channels. The regular contributions, or core contributions, are one such channel. The core funding is mainly obtained by government payments to the UNDP. Each government decides for itself what would the size of its yearly contribution to the UNDP be. Core contributions account for roughly one third of the funding the organization gathers (UNDP 2019a). The official public web platform of the program states that more than \$5 billion were raised in 2018 alone (UNDP 2019a).

Top government contributors to the UNDP in 2018 were Germany, Japan, United States, Sweden, United Kingdom, Ukraine, Norway, Argentina, Netherlands, and Switzerland (UNDP 2019b).

Another channel for fundraising, which is more preferred by donors nowadays, is the so-called earmarked non-core funding. While core funding is given by donors to the organization with no specific area in which the funding should be spent, “earmarked” funding are contributions that donors provide to the organization with a specific purpose – for example, the contribution is to be utilized for climate change action projects, or women’s rights projects, etc.

Non-core funding is raised both by governments – more and more do governments turn to “earmarked” type of contribution – and by other donors, such as financial institutions, vertical funds, non-governmental organizations, foundations, pooling funding, etc.

In accordance with its transparency principles, the UNDP publishes online information about all contributions that it receives on a yearly basis, and project funding as well, on its public online platform, the SDG Impact initiative, the UNDP Accelerators labs, the UNDP Innovation facility, etc. (UNDP 2019a).

UNDP Reports and Development Research

Since 1990, the UNDP has been publishing the annual Human Development Report (HDR) each year. The report does not focus constantly on a specific sector (e.g., trade, labor, agriculture), but instead considers a different theme each year, with the constant focus on the problems of human development (Klingebiel and Hildebrand 2010b).

UNDP publishes annually the global Human Development Report (HDR) which is a report that tracks global and national progress relative to a set of development indicators (Murphy 2013). Indicators include different spheres of development such as eliminating poverty, providing access to clean water, optimizing government action, promotion of education and social inclusion, etc. The UNDP has also sponsored the production of local, national, and regional *Human Development Reports* (Murphy 2013). The HDR is considered to be one of the key regular reports that shine a light on the status of development across countries.

UNDP reports are categorized into global, regional, and national Human Development Reports. The UNDP also issues additional research reports on development, and occasional research papers by associated authors. The agency hosts a database of development-related statistical information which is included in the Human Development Reports. There are several composite indices of human development indices – the Human Development Index (HDI), the Inequality-adjusted Human Development Index (IHDI), the Gender Development Index (GDI), the Gender Inequality Index (GII), and the Multidimensional Poverty Index (MPI) (UNDP 2020a).

UNDP and the Sustainable Development Goals

UNDP is the main UN agency related to development issues. It mostly focuses on social aspects of development, rather than economic development.

UNDP has been considered as a key agency for the achievement of the United Nations

Sustainable Development Goals (SDGs) (Fraser 2019). The SDGs, also known as the Global Goals, are a universal call to action set by the United Nations. Building on the Millennium Development Goals (UN goals until 2015), the SDGs are 17 goals oriented toward poverty alleviation, climate protection, ensuring global peace, prosperity, and equality to all people. Key feature of the goals is interconnectedness, which corresponds with the idea of interdependence in sustainable development (Fraser 2019).

The SDGs were introduced in January 2016, and they are set to guide UNDP policy and funding until 2030. As the lead UN development agency, UNDP is uniquely placed to help implement the Goals through practical development projects in all UNDP partner countries and territories.

UNDP is conducting various initiatives that aim to promote the achieving of the SDGs. Such initiatives are the UNDP Climate promise initiative, the Small Island Developing States (SIDS) Offer, the UN Transitions Project, the Finance Sector Hub, etc. (UNDP 2021).

Summary

The United Nations Development Programme is one of the core specialized agencies of the United Nations. Its role in fostering development in developing countries and least developed countries (LDCs) takes the UNDP to the forefront of global sustainable development. The program is considered a reliable partner for development projects and has been administering numerous development initiatives throughout the globe.

The UNDP has a crucial role in the pursuit of the United Nations SDGs. It conducts various initiatives with its partners that aim to promote the development and adoption of sustainability.

The UNDP is the UN's major agency for fostering funding for different development projects, and it has a large number of contributors. The most of the UNDP's funding comes from nation states in the form of general purpose contributions or ear-marked contributions.

[UN Environment Programme](#)

Definition

The United Nations Environmental Program (UNEP) is the leading environmental authority of the United Nations. Its headquarters was established Nairobi, Kenya, on 5 June 1972. The Programme was established after the United Nations Conference on the Human Environment held in Stockholm, 1972 (Siboni and Sangiorgi, 2013). The United Nations chose Nairobi as the Programme's headquarters to reflect its mandate to focus on developing countries. However, it operates internationally through a range of divisions, as well as regional offices.

At the time of its establishment UNEP had a staff of 300, including 100 experts from a range of fields. Funding of more than US\$100 million for the first 5 years was provided by 50 nations, with a US\$40 million contribution from the United States. Currently, about 95% of UNEP's income is from voluntary funding provided by its partners (UNEP, 2020).

UNEP finances its activities from two funds. The first, the Environment Fund, is the principal source of funds, supporting its core activities worldwide, and, in particular, the implementation of the UNEP work program. The second are earmarked funds, which are funds given for the purposes of a specific project, theme, country, etc. These funds are mostly via by the Global Environment Facility, the Green Climate Fund, and the European Commission.

Introduction

The United Nations Environmental Programme was established to lead nations worldwide in environmental initiatives and to promote and support the implementation of sustainable development. Its focus is on policymaking, setting the global environmental agenda. It also initiates specific projects that are aimed at enhancing sustainability, using the established systems of the United Nations to advocate and enact global environmental change. Its work is underpinned by the principles of the UN Agendas, specifically, Agenda 21 and Agenda 2030 that are targeted at identifying and addressing critical contemporary environmental issues.

UNEP's mission is to guide and lead nations around the world in a partnership approach. It does so via inspiring, informing, and enabling nations and their citizens to improve their quality of life while also considering the importance of protecting the world for future generations.

UNEP's Approach

UNEP approach relies on scientific research, which is the foundation of its program. On this basis it builds strategies aimed at key environmental issues. With these two carefully developed themes it is then able to work with nations to gain political support. Key to this approach is UNEP's development of "soft law" guidelines or principles, which are an effective way of engaging nation states as a precursor to the development of binding international law (UNEP, 2020).

To further its environmental aims, UNEP assesses global, regional, and national environmental conditions and trends. Based on these it works towards key endeavors that will support nations in enacting environmental change. These include international and national environmental instruments and strengthening institutions for the purposes of good environmental governance. To do so, UNEP works closely with its member states and develops relationships with a range of stakeholders including policymakers, industry, and community groups.

The effectiveness of UNEP's operations relies on these core activities.

- Monitoring of the environment via a range of instruments and indices, to gather and disseminate environmental information.
- Promoting international cooperation to develop and implement policies that support sustainable development.
- Catalyzing environmental awareness and action by government, industry, and society to address major environmental threats.
- Helping to develop international environmental law by providing expertise on all issues relating to the environmental governance, concepts, and instruments.
- Coordinating UN activities related to environmental action, based on principles of cooperation, liaison, and participation.
- Developing regional programs for sustainability.
- Capacity building and technology support at the country level.
- Making available support and advice on environmental policy, when needed and requested by its members, in particular with the goal of supporting developing countries and emerging economies.

UNEP's Governance System

UNEP's governance system comprises the UN Environment Assembly (formerly Governing Council) and the Committee of Permanent Representatives (Petsonk, 1990). Originally, the Governing Council of UNEP was composed of 58 states. These states were not necessarily members of the UN. During the Rio+20 UN Conference in 2012, the UN General Assembly resolved to reaffirm and strengthen the governance and role of UNEP as part of the UN more broadly, by creating the UN Environment Assembly to replace the Governing Council. Membership of the Assembly was automatically provided to all 193 UN member states. The Assembly meets biennially in Nairobi. During these meetings it

debates and decides on policies and issues, and sets UNEP's agenda, including its environmental law program.

The Committee of Permanent Representatives provides policy advice to the UN Environment Assembly. It comprises 122 members who work together to provide the agenda for the Assembly's meetings, which take place four times each year, and oversee implementation of policies adopted by the Assembly. The Committee is led by a five-member executive, elected for a period of 2 years. Each member of the executive is a representative of one of the five UN regional groups of member states. The outcomes of the Committee's meetings are available in the documents section of the UNEP website (UNEP, 2020).

Organizational Structure

UNEP's organizational structure is led by its Executive Office, consisting of its Executive Director, Deputy Executive Deputy, and Chief of Staff. The Executive have oversight of the following: New York Office Secretariat/Secretariat of the Environment Management Group; Chief Scientist; Evaluation Office; Governance Affairs Office/Secretariat of Governing Bodies; Crisis Management Branch. Its global reach is evidenced in its regional and subregional office locations (<https://www.unenvironment.org/>):

- Africa Office, including West Africa Sub-regional Office, South Africa Country Office, Addis Ababa Liaison Office
- Asia and the Pacific Office, including Pacific Sub-regional Office, China Country Office, India Country Office
- Europe Office, including Central Asia Sub-regional Office, Russian Federation Country Office, Brussels Liaison Office, Vienna Programme Office
- Latin America and the Caribbean Office, including Caribbean Sub-regional Office, Southern Cone Sub-regional Office, Brazil Country Office, Mexico Country Office
- North America Office

- West Asia Office

UNEP also comprises several divisions reflecting the range of work in which it engages: Communication, Economy, Ecosystem, Law, Science, Policy and Programme, and Corporate Services. Moreover, UNEP has created a network of centers of excellence that collaborate to develop and implement environmental programs and projects.

In addition, UNEP oversees international conventions, including the following:

- The Convention on Biological Diversity
- The Convention on International Trade in Endangered Species of Wild Fauna and Flora
- The Minamata Convention on Mercury
- The Basel, Rotterdam and Stockholm Conventions
- The Vienna Convention for the Protection of Ozone Layer and the Montreal Protocol
- The Convention on Migratory Species
- The Carpathian Convention
- The Bamako Convention
- The Tehran Convention

UNEP coordinates interagency bodies working cooperatively on environmental issues and initiatives and has oversight of a number of secretariats working on multilateral environmental agreements, as well as several important collaborative research organizations and institutes.

UNEP Working Program: Strategic Areas of Intervention

UNEP has established seven thematic programs on which it bases the work of its members, across regions and sub-regions. These seven themes are outlined below.

1. **Climate Change.** UNEP is committed to supporting research on climate change. Its aim is to facilitate a transition to low-carbon societies, using research to support the development of renewable energy and to raise awareness of the importance of taking action

to avoid the consequences of climate change. It supports countries in developing and implementing climate change actions and provides leadership as well as advice and action in terms of technology, resources, finance.

2. **Disasters and Conflicts.** UNEP has a particular focus on action in crisis-affected countries and provides guidance for implementing legislative and institutional frameworks aimed at environmental improvement and disaster mitigation. It has taken action in areas that have been subject to conflict, such as Afghanistan, Côte d'Ivoire, Lebanon, Nigeria, and Sudan.
3. **Ecosystem Management.** UNEP supports the management and restoration of ecosystems for members and nation states around the world. Its support for ecosystems falls under its initiative, the Global Programme of Action for the Protection of the Marine Environment from Land-Based Activities.
4. **Environmental Governance.** As recognition of the importance of governance in underpinning environmental initiatives, UNEP assists governments to formulate, implement, and strengthen policies, processes, and programs that support the implementation of sustainable development. Key to this assistance is supporting the institutional and legal context within individual countries and in an overarching sense at regional and global levels. UNEP's aim in environmental governance is to bring sustainable development to the foreground of all development activity.
5. **Harmful Substance (Chemicals and Waste).** UNEP is focused on eliminating or minimizing harmful substances and hazardous waste and their impact on the environment and society. It negotiates international agreements and projects, such as the Strategic Approach to International Chemicals Management.
6. **Resource Efficiency (Sustainable Consumption and Production).** Given recent demands on the earth's resources due to consumption in developed and developing economies, UNEP is focusing on effective management of natural resources in terms of production, process, and consumption (Garrette, 2007). For example,

the Marrakesh Process is a global strategy supporting the creation and implementation of a 10-Year Framework of Programmes aimed at action toward sustainable consumption and production.

7. **Environment under Review.** UNEP has taken a global leadership role in raising awareness of environmental issues. It aims to provide information to policymakers and stakeholders about important environmental issues, such as air pollution. It achieves this by information provision via instruments that monitor resource use, access maps, publications, and other resources that are made available on UNEP's Environment Live platform. UNEP regularly publishes its Global Environment Outlook, which through its assessments and monitoring creates a comprehensive picture of the nexus between the environment and societal wellbeing. The sixth Global Environment Outlook (GEO-6) sets the stage for implementation of the 2030 Sustainable Development Agenda and will assist national, regional, and global efforts to achieve the UN Sustainable Development Goals. Through its Shared Environmental Information System (SEIS) project, UNEP assists countries in developing their own environmental reports and sharing their environmental data. This project is active in 20 countries in Africa, Asia, and Central Asia.

[UN Environment Finance Initiative](#); [UNEP FI](#)

Definition

United Nations Environment Programme Finance Initiative (UNEP FI) is a partnership between the United Nations Environment Programme and the global financial sector (UNEP FI 2020b). It was created in 1992 in relation to the Rio Earth Summit, and it is headquartered in Geneva, Switzerland (UNEP FI 2020b).

The goal of the UNEP FI is to promote sustainable finance (Ziolo et al. 2019). The Positive Impact finance concept was developed by the

UNEP FI, and it is oriented toward financing business that has a positive impact on at least one of the pillars of sustainable development (UNEP FI 2017).

Members of UNEP FI are more than 400 institutions from the banking, insurance, and investment industries (UNEP FI 2020b). More than 100 supporting organizations related to these industries are also associated to the UNEP FI (UNEP FI 2020b). It is one of the international initiatives that supports the financial sector gain a better understanding on the significance of finance on the different aspects of environmental challenges, and how investment could be directed toward sustainable development (G20 2016).

UNEP FI also has a policy-oriented perspective. By providing different forums of cooperation and dialogue, such as country-level forums, it facilitates the dialogue between finance practitioners and policy-makers.

The Goal of Sustainable Finance

Sustainable finance refers to the variety of financial services that facilitate the combination of long-term ecological, social, and economic aspects of decision-making in different economic sectors and business spheres (Ziolo et al. 2019, p. 66).

Green finance is regarded to play a role in environmental damage mitigation related to the impact of climate change on the economic system. Climate change poses new risks for the natural and economic systems, and finance toward the mitigation of these risks is stepping up (Ghoul 2019, p. 301). Green finance has begun to play a more significant role as a facilitator of the rising trend of green growth.

Among the UN agencies that facilitate issues of sustainable and green finance, the United Nations Environment Programme (UNEP) and its Finance Initiative (UNEP FI) are considered to be of key importance. The categories of UNEP's activity are as follows:

- Assessment of the state of the natural environment and publishing thematic reports

- Formulation of international environmental agreements
- Support to organizations working for the sustainable management of environmental resources
- Support to activities aimed at integrating economic development with environmental protection
- Dissemination of knowledge and technology relevant to sustainable development
- Support of partnerships between the public and private sectors
- Patron of international initiatives related to the natural environment (Ziolo et al. 2019, p. 66)

International collaboration among different stakeholders such as market participants, central banks, finance ministries, and regulators is growing. The cooperation is mainly focused on knowledge sharing and capacity building in the sphere of green finance. Agencies such as the UNEP FI aim to promote sustainable lending, investment, and insurance (G20 2016).

History

In 1991, a group of commercial bankers got together and proposed the idea of a group to help spread awareness about the environmental calendar (UNEP FI 2021). In 1992, the UNEP Statement by Banks on Environment and Sustainable Development was launched in New York after the Earth Summit in Rio de Janeiro, to insure that sustainable development, among other issues, could be improved. This new initiative brought a broad range of financial institutions on board such as commercial and investment banks (UNEP 2021).

In 1997, this statement was redrafted in order to be more broad in its appeal and was renamed the UNEP Statement by Financial Institutions on the Environment and Sustainable Development (UNEP FI 2021). The Banking Initiative was renamed The Financial Institutions Initiative (FII). In 2003, the two groups were merged with this group, then called the UNEP Finance Initiative (UNEP FI 2021).

In the period 2010–2011, UNEP FI finalized the UNEP Statement of Commitment by Financial

Institutions on Sustainable Development by merging the Statement by Financial Institutions on the Environment and Sustainable Development and the UNEP Statement of Environmental Commitment.

Since 1994, UNEP FI hosts a Global Roundtable every other year. The Global Roundtable is an agenda-setting discussion forum that aims to bring together members of the sustainable finance community. In 2017, the UNEP FI initiated a regional roundtable initiative.

In recent years, UNEP FI has worked with actors from the banking industry to put systems to manage so-called “environmental, social and governance” (ESG) issues (G20 2016).

Organization and Governance

The UNEP FI’s working agenda is determined by a Global Steering Committee that consists of representatives of the member institutions and UN

Environment’s representatives (Fig. 1). Broader strategic decisions are made and confirmed at the UNEP FI Annual General Meeting (AGM), which takes place once a year. The key event of the UNEP FI is the Annual General Meeting (AGM) (UNEP FI 2020b).

The Global Steering Committee is composed of representatives of the core members of UNEP FI and is in charge of establishing the strategic orientation of the UNEP FI. The Industry Committees (the three UNEP FI industries are banking, investment, and insurance) are operative bodies of the initiative. The different thematic boards of the initiative reflect the main strategic goals and ensure their pursuance. Such boards are created on different topics such as climate change, sound environmental management, positive impact investment, etc. Regional advisory boards are in charge of coordinating UNEP FI actions in different global regions – Africa and Middle East, Asia Pacific, Europe, Latin America, and North America.

United Nations Environment Programme Finance Initiative, Fig. 1 UNEP FI governance structure. (Source: UNEP FI (2019a). UNEP Finance

Initiative Structure. <https://www.unepfi.org/about/structure/>. Accessed 11th October 2019)

Statement of Commitment and Principles of Responsible Banking

In its effort to put in place systems to manage the “environmental, social and governance” (ESG) issues (G20 2016), the UNEP FI developed key documents that members of UNEP FI must sign in order to become members of the Initiative, namely the Statement of Commitment by Financial Institutions on Sustainable Development, and the Statement of Environmental Commitment for the Insurance Industry (UNEP FI 2019b). The Statement by Financial Institutions on the Environment and Sustainable Development was designed in 1992 and revised in 1997 in order to include other institutions than banks (UNEP FI 2019c). The Statement of Environmental Commitment for the Insurance Industry is the relevant statement of commitment for insurance companies that become members of the UNEP FI (UNEP FI 2019c). The Statement acknowledges the role of the financial services sector in achieving sustainable development and states a commitment of organizations to strive to provide as much assistance as needed in order to improve the economy, business practices, and organizational structures toward integration of environmental and social aspects into their practices and operations (UNEP FI 2020a). Both Statements focus on the commitment of financial enterprises to environmental sustainability. Focus on internal operations, environmental risk assessment, and development of products and services is provided (UNEP FI 2020a, b). The Statements promote active environmental protection.

A similar direction with regard to impact is taken by the Principles for Responsible Banking. They are a part of UNEP FI and focus on climate change and align banking with the SDGs and Paris Climate Goals. As of March 2019, 49 banks and a number of stakeholders have endorsed the Principles of Responsible Banking (Weber and ElAlfy 2019).

The principles aim to provide a foundation for signatories to proactively consult and engage stakeholders with sustainable practices, as well as to establish governance practices to achieve the sustainability targets. Transparency and accountability are key components in the sustainability

achievement practices. The principles are considered as the first conventional financial industry code of conduct that explicitly addresses the role of banks on sustainable development and climate change (Weber and ElAlfy 2019).

Box 1: Principles for Positive Impact Finance

Principle 1:

Positive Impact Finance is that which serves to finance Positive Impact Business, serving to deliver a positive contribution to one or more of the three pillars of sustainable development (economic, environmental, and social) (UNEP FI 2017)

Principle 2:

To promote the delivery of Positive Impact Finance, entities (financial or non-financial) need adequate processes, methodologies, and tools, to identify and monitor the positive impact of their activities (UNEP FI 2017)

Principle 3:

Entities (financial or nonfinancial) providing Positive Impact Finance should provide transparency and disclosure on their activities (UNEP FI 2017)

Principle 4:

The assessment of Positive Impact Finance, delivered by entities (financial or nonfinancial), should be based on the actual impacts achieved (UNEP FI 2017)

Source: UNEP FI (2017). The Principles of Positive Impact Finance: A Common Framework to Finance the Sustainable Development Goals. <https://www.unepfi.org/wordpress/wp-content/uploads/2017/01/POSITIVE-IMPACTPRINCIPLES-AW-WEB.pdf>. Accessed 12 August 2021.

Criticism of the UNEP FI

Criticism of the UNEP FI is associated with the application and execution of projects and initiatives. One line of criticism is toward application, which is sometimes considered limited due to lack

of consistency between risk management and green lending guidelines. Another line of criticism concerns the difficulties in measuring the provision and performance of clean energy lending which have been attributed to the UNEP FI (Purkayastha 2019).

Summary

UNEP FI is a key UN Environment unit that brings together representatives of the global financial sector with the purpose to establish a framework for sound sustainable development in both business and society. It is considered an influential organizational structure in the realm of sustainable business and investment. The UNEP FI Statements of Commitment and Principles of Responsible Banking are considered as an important part of the formalization of environmental protection-oriented banking. As the idea of green banking continues its development, recommendations of better application procedures of the initiatives have been raised.

[Global compact](#); [UN global compact](#)

Definition/Description

The United Nations (UN) Global Compact is a call to companies to align their strategies and operations with ten universal principles in the areas of human rights, labor, environment, and anti-corruption, and to take actions that advance societal goals (UN Global Compact 2017, p. 3). The UN Global Compacts’ vision is “to mobilize a global movement of sustainable companies and stakeholder to create the world we want” (UN Global Compact 2021a). It is a global network with local presence all around the world.

At global level, the UN Global Compact established “a leadership platform for the development, implementation and disclosure of responsible corporate practices” (UN Global Compact 2014, p. 47). Furthermore, at local level, the Global Compact established Local Networks (i) to support businesses establishing and maintaining responsible practices considering their specific cultural, national, regional, and language contexts, (ii) to offer various formats for dialogues, learning, and partnerships (e.g., policy dialogues, issue-specific training, and workshops), as well as (iii) to connect companies with other stakeholder such as governments, NGOs, and academia to jointly foster sustainability activities (e.g., networking events, collectives action projects) (UN Global Compact 2021b).

Launched in 2000, the UN Global Compact is seen as world’s largest voluntary corporate sustainability initiative, with currently over 13,000 companies representing nearly every sector and size and 4000 organizations based in 160 countries (for up-to-date numbers check the website, UN Global Compact 2021c) and around 70 Local Networks (UN Global Compact 2021d).

Ten Principles of the UN Global Compact

The foundation of responsible businesses lies in a values system based on fundamental principles. UN Global Compact believes that responsible businesses enact the same values and principles

wherever they are active. Therefore, they developed Ten Principles in the field of human rights, labor, environment, and anti-corruption (see Table 1) which companies should incorporate into strategies, policies, and procedures.

These principles are derived from the following international documents (UN Global Compact 2021e): the UN Universal Declaration of Human Rights (United Nations 1948), the International Labour Organization’s Declaration on Fundamental Principles and Rights at Work (ILO 1998), the Rio Declaration on Environment and Development (United Nations 1992), and the UN Convention Against Corruption (UNCAC 2004). The principles one to nine were published in 2000. The tenth principle against corruption was adopted in 2004.

United Nations Global Compact, Table 1 Ten Principles of the UN Global Compact

HUMAN RIGHTS	
Principle 1:	Businesses should support and respect the protection of internationally proclaimed human rights; and
Principle 2:	Make sure that they are not complicit in human rights abuses.
LABOUR	
Principle 3:	Businesses should uphold the freedom of association and the effective recognition of the right to collective bargaining;
Principle 4:	The elimination of all forms of forced and compulsory labour;
Principle 5:	The effective abolition of child labour; and
Principle 6:	The elimination of discrimination in respect of employment and occupation.
ENVIRONMENT	
Principle 7:	Businesses should support a precautionary approach to environmental challenges;
Principle 8:	Undertake initiatives to promote greater environmental responsibility; and
Principle 9:	Encourage the development and diffusion of environmentally friendly technologies.
ANTI-CORRUPTION	
Principle 10:	Businesses should work against corruption in all its forms, including extortion and bribery.

Source: UN Global Compact 2021e

Vision and Mission

The UN Global Compact aims at creating a global movement of sustainable organizations. They published the following vision: “To mobilize a global movement of sustainable companies and stakeholder to create the world we want” (UN Global Compact 2021a).

In accordance to this, the UN Global Compact has the mission to support companies to:

1. “Do business responsibly by aligning their strategies and operations with Ten Principles on human rights, labour, environment and anti-corruption; and
2. Take strategic actions to advance broader societal goals, such as the UN Sustainable Development Goals, with an emphasis on collaboration and innovation.” (UN Global Compact 2021a)

Global Strategy 2030

How can the UN Global Compact support responsible business action? How can they support businesses delivering on the UN Sustainable Development Goals (SDGs), the world’s common agenda for achieving peace and prosperity for people and the planet (United Nations 2015)? These questions were part of UN Global Compact’s global strategy development process (UN Global Compact 2021f).

As a normative, principle-based and inclusive UN entity, the UN Global Compact decided to create a global movement of sustainable businesses and other stakeholders and to become the “translator” of the SDGs for business everywhere. The new global strategy lays emphasis on how the UN Global Compact participants as powerful private sector network can deliver on the SDGs with a huge impact and scale.

Currently, in the UN Global Compact Strategy 2021–2023 the following five focus areas have been defined (UN Global Compact 2021f; for details see also UN Global Compact 2021g):

1. *Holding companies accountable*: The UN Global Compact will support their participants to demonstrate their contribution to the UN principles and the SDGs and will hold participants accountable.
2. *A balanced growth of local and regional networks*: The UN Global Compact plans to continue to establish new local and regional networks.
3. *Measuring impact in priority areas*: The UN Global Compact prioritizes the following five SDGs based on their Ten Principles: Gender Equality (SDG 5), Decent Work and Economic Growth (SDG 8), Climate Action (SDG 13), Peace, Justice and Strong Institutions (SDG 16), and Partnerships (SDG 17).
4. *Harnessing the collective action of small and medium-sized businesses (SMEs)*: The UN Global Compact will focus on creating specific SME programs, as SMEs are worldwide important players in promoting the SDGs, and especially in emerging and developing countries.
5. *Engage more actively with the United Nations and its partners*: The UN Global Compact will deepen their collaboration with UN agencies and country teams on all levels.

The UN Global Compact aims at continuously strengthen their global network with local presence all around the world and established UN Global Compact Local Networks to support businesses establishing and advancing responsible business practices by providing, e.g., trainings, knowledge exchange, and networking opportunities among local business partners (UN Global Compact 2021b).

Signatories & Participants

The number of participants who have signed the UN Global Compact is steadily growing. Currently, this initiative is counting more than 13,000 companies and 4,000 organizations representing multitudes of sector and sizes of

organizations (for up-to-date numbers check the website, UN Global Compact [2021c](#)).

Since 2018, the UN Global Compact introduced two distinct engagement tiers to tailor their support for business: participant or signatory. Participants actively engage with the UN Global Compact at the global level, and at their national or regional level with full access to all resources. Signatories actively engage with the UN Global Compact at their national or regional level.

The value proposition of engagement consist of three categories (UN Global Compact [2017](#), p. 9): (1) *communicate your commitments*, e.g., by providing a digital profile on UN Global Compact website, (2) *easily access tools and resources*, e.g., by providing access to sustainability content and learning in the UN Global Compact digital library and academy as well as self-assessment and benchmarking with the UN Global compact navigator, and (3) *global reach and connections*, e.g., by providing access to UN Global Compact global events and advisory and support services strengthening partnerships.

UN Global Compact Management Model and Communication on Progress (COP)

The UN Global Compact developed a management model to help companies of all sizes align their sustainability strategy (UN Global Compact [2010](#)). How can companies implement the Ten Principles in strategy and operations? Which organizational culture is supportive? Is organizational change required? The UN Global Compact Management Model describes six steps for implementing the Ten Principles (UN Global Compact [2010](#), p. 8):

1. *Commit*: Leadership commitment to mainstream the Global Compact principles into strategies and operations and to act in support of broader UN goals, in a transparent way.
2. *Assess*: Assess risks, opportunities, and impacts across Global Compact issue areas.
3. *Define*: Define goals, strategies, and policies.

4. *Implement*: Implement strategies and policies through the company and across the company's value chain.
5. *Measure*: Measure and monitor impacts and progress toward goals.
6. *Communicate*: Communicate progress and strategies and engage with stakeholders for continuous improvement.

Each step contains suggestions for activities and focus areas. The process is iterative and ongoing.

The last step “communicate” is also important for remaining member in this global initiative: The UN Global Compact requires participants to publish annually their Communication on Progress (COP) (UN Global Compact [2021h](#)). In this annual disclosure to stakeholders, companies announce their process made in embedding the Ten Principles into their strategic and operational levels and how they support the SDGs (UN Global Compact [2021i](#)). The status of participants that fail to report on the COP minimum requirements or to upload their COP report on time will change to “non-communicating” and – eventually – these participants will be expelled from the initiative (UN Global Compact [2015a, b](#)).

Summary

The UN Global Compact aims at integrating Ten Principles in the field of human rights, labor, environment, and anti-corruption into business strategies and operations and at thus mobilizing action for a sustainable development. As important pillar of the UN private sector engagement, the UN Global Compact supports the SDGs by enabling (new) partnerships and collaboration among their participants on local, regional, and global level. Furthermore, the UN Global Compact has contributed creating and supporting several global action networks, such as the Principles for Responsible Investment (PRI [2021](#)) and

Principles for Responsible Management Education (PRME 2021) (Kell 2012). In all these global action networks the discourse on responsible business practices will be continued.

Definition

The United Nations Human Rights Committee is the monitoring committee for the International Covenant on Civil and Political Rights. It serves those member states of the United Nations who have signed up and ratified or acceded to the Covenant and, optionally, either of its Protocols.

Background to the United Nations

Early Years

The Great Depression of the 1930s started in the United States in 1929 and continued until the mid-1930s. It is generally attributed to a substantial reduction in aggregate demand within the US economy that led to significant declines in local manufacturing. This caused unprecedented unemployment that migrated to other economies, due mainly to fiscal regulation being reliant on the gold standard, and this resulted in a worldwide recession. This demonstrated the financial interrelatedness and reliance of economies and the lack and fragility of the systems in place. The World Economic Conference of 1931 was convened to establish economic protocols and multilateral agreements that protected against recurrences. Although unsuccessful, it prompted the British economist John Maynard Keynes to develop and

publish proposals that challenged international free trade arrangements and that were designed to encourage full employment (e.g., *The General Theory of Employment, Interest and Money* (1936)). He particularly advocated the introduction of trade tariffs and protectionist policies regulated by governments to address extreme trade imbalances. This view was taken up in the Bretton Woods conference in 1942 and acted as the instigator for the creation of the World Bank and International Monetary Fund (Williamson 1985; Helleiner 2014), two of the four pillar system of international support that Keynes envisaged (Singer 1995).

World War I and the League of Nations

Meanwhile, in the immediate aftermath of World War I, the League of Nations/Société des Nations was introduced as an international diplomacy grouping of prominent nations to ensure that disputes among nations were resolved through peaceful means (Walters 1952). Of particular note was the acceptance and inclusion of social well-being provisions for the citizens of nations. The covenant was signed in June 1919 and the League formally came into effect in January 1920. Due to a lack of commitment by member countries and, especially, with the outbreak of World War II, the League was, however, formally dissolved in April 1946.

World War II: The Aftermath and Setting Up of the United Nations

World War II and its immediate aftermath prompted a period of intense reflection by the international community to further establish measures to both encourage universal economic stability and social well-being for citizens, the fourth pillar identified by the Bretton Woods Institutions (Singer 1995), and to avoid another destructive war while avoiding the pitfalls of the failing (and failed) League. This led to the introduction of the United Nations.

In 1941, following the Declaration of St James's Palace, as a result of the conference of inter-allied member state representatives, Churchill, the British prime minister, and Roosevelt, the US president, drafted the Atlantic Charter that defined, among specific war-related issues, the social goals and objectives that were to follow

the conclusion of World War II. These overall principles were formally adopted by the governments of states then under occupation by the Axis aggressor countries, who were resident in the United Kingdom, the Soviet Union, and representatives of the free French state. On New Year's Day, 1942, Churchill, Roosevelt, and Litvinov and Soong, representing the USSR and China, respectively, signed an abridged document that formed the basis for the subsequent formal Declaration of the United Nations (Simma 1995). This included precepts based on the fundamental principles of universal human rights, as articulated in the Atlantic Charter.

The structure and location for this new United Nations international inter-government organization were agreed by Britain, the United States, the USSR, and China at Dumbarton Oaks in Washington, D.C., in 1944. Fifty governments met at the United Nations Conference on International Organization in San Francisco where the formal draft for the UN Charter was finally developed and subsequently ratified by the constituent member states in June 1945, with the UN finally coming into being on October 24, 1945 (Luard 1982).

For the structure, it was agreed that the organization would initially consist of four main bodies: a General Assembly of representatives from all member states; a Secretariat; a Security Council comprised of five permanent member states, supplemented by additional six members with fixed-term appointments, and who are selected by the General Assembly; and an International Court of Justice. In addition, the Economic and Social Council (ECOSOC) was formed under the aegis of the General Council, with specific responsibility for promoting human rights among member states. The UN Charter formally designated the two Bretton Woods Institutions as specialized agencies of the UN with these, together with other specialized agencies, being coordinated by the ECOSOC.

It was agreed that the United Nations headquarters would be located on designated international territory in New York City with other main offices in Geneva (Switzerland), Nairobi (Kenya), and Vienna (Austria) and the International Court of Justice at The Hague (Netherlands).

Notwithstanding its obvious and well-documented failings, the principles and overarching social objectives were established by the League of Nations and so it can rightly be viewed as a precursor to the United Nations. The influence that the Bretton Woods Institutions had was also instrumental.

In addition to mediating international conflicts to help maintain peace, the objectives of the UN Charter were geared at establishing and protecting human rights for citizens, providing humanitarian aid, upholding international law, and promoting sustainable development. At present, the United Nations now has six main bodies: the original four and the ECOSOC, supplemented by the Trustees Council. It also has a further collection of agencies, programs, and support funds such as the World Bank; World Health Organization (WHO); United Nations Educational, Scientific and Cultural Organization (UNESCO); United Nations International Children's Emergency Fund (UNICEF); and the World Food Program. It currently has 193 member states.

With acceptance by such a high proportion of the sovereign states, the United Nations Charter is considered by many as having the status of an International Treaty and instrument of International Law, with its member states, effectively, bound by its instruments. These champion the notion of equality of sovereign states and direct the following of appropriate international relations in all dealings, including prohibiting the use of military force to resolve conflicts.

Having set the context of the United Nations as an organization and its conglomerates, their remit, and the vested powers of the UN Charter, we now look to the human rights aspects of the UN.

Universal Declaration of Human Rights

The United Nations Charter (1945) identified the need to promote human rights and fundamental freedoms for all, not least, due to the atrocities committed in World War II and revelations from the Nuremberg Trials of 1945 and 1946.

In June 1946, the United Nations Economic and Social Council created the Commission on Human

Rights standing committee to introduce an International Bill of Rights. A drafting committee, under the auspices of chair, Eleanor Roosevelt, the wife of the US president, was convened for this purpose. Their approved Declaration and associated Covenant were submitted by the Commission to the Economic and Social Council and, after their adoption on August 26, 1948, were subsequently adopted by the United Nations General Assembly on December 10, 1948 (Morsink 1999).

In 1966, the General Assembly adopted the two international human rights covenants: the International Covenant on Economic, Social and Cultural Rights and the International Covenant on Civil and Political Rights (Joseph and Castan 2013), and an additional five fundamental core human rights treaties to support the civil and political rights that are covered in the Declaration: the International Convention on the Elimination of All Forms of Racial Discrimination (1965); the Convention on the Elimination of All Forms of Racial Discrimination Against Women (1979); the Convention Against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment (1984); the Convention on the Rights of the Child (1989); and the International Convention on the Protection of the Rights of All Migrant Workers and Members of Their Families (1990). These all have legally binding powers.

Each also has an associated independent monitoring committee, established by their treaty, that oversees the operation and implementation of their specialized area of human rights. Corporate human rights responsibilities for transnational corporations and business enterprises were later introduced in the Guiding Principles for Business and Human Rights framework. This was developed by John Ruggie (Cornelius and Wallace 2023) and endorsed by the United Nations Human Rights Council in 2011.

The United Nations Human Rights Committee

Responsibilities of the UN Human Rights Committee

The United Nations Human Rights Committee is the monitoring committee for the implementation

and maintenance of civil and political rights, as specified in the International Covenant on Civil and Political Rights, for those member states of the United Nations who have signed up to the Covenant (Buergenthal 2001). This includes its two Optional Protocols.

The General Assembly adopted the Covenant in 1966 but only came into force on March 23, 1976, at the point where the necessary minimum number of 35 member states formally agreed to be bound by the treaty (and its Optional Protocols). Since then, the majority of United Nations member states have committed to the Covenant – for a list of the relevant states, see the database for the Office of the United Nations High Commissioner for Human Rights (<http://www.unhchr.ch/tbs/doc.nsf>).

A state becomes bound to the Covenant through one of two distinct routes. It can either sign the treaty, followed by ratifying this to formally state its intention to be bound by the terms of the treaty, or accede to the treaty. By accession, the state does not sign the treaty but agrees to be bound by its terms and this is considered equivalent to ratification. After ratification, the state has three months before it is bound by the terms of the Covenant.

In addition to the Covenant, member states have the option of being party to the Optional Protocols. The first came into force at the inception of the Covenant and details the process whereby the Committee deals with claims of violations of their human rights by individual citizens (Shikhelmman 2018). The second Optional Protocol requires abolition of the death penalty for the member state and came into force on July 11, 1991. The Covenant has no provision for withdrawal by any state that has become a member and, similarly, from the second Optional Protocol by those who sign up to this. There is, however, a procedure within the Covenant for withdrawal from the first Optional Protocol. Several of the rights present in the Covenant are also subject to permitted restriction or limitation by the member state without being considered a violation. Such an action does, however, require the state to provide a suitable justification on the grounds of legality, legitimate purpose, necessity, or reasonableness.

The United Nations Human Rights Committee was established by actioning Article 28 of the Covenant. The instigation, remit, functioning, and procedures of the Human Rights Committee, as a monitoring body for the Covenant and its Optional Protocols, are formally stated in Articles 28–45 of the Covenant.

Membership of the UN Human Rights Committee

The UN Human Rights Committee comprises 18 “expert” members possessing recognized high moral standing and with knowledge and competence of human rights (Article 28). Each must be a national of a constituent state party who nominates them for membership, with Article 31 limiting such representation to, at most, a single representative from any particular state. Article 31 also advocates consideration be given to accepting Committee members from nominating states that suitably represent the diversity of political and legal systems in place while providing an “equitable” representative geographic distribution, overall. The latter is also suggested to potentially capture linguistic diversity of the Committee members. As an expedient, most elected members should also have a suitable legal background and experience.

Elections to the UN Human Rights Committee

Election to the Committee for a four-year term is by secret ballot of all member states at a United Nations General Assembly annual meeting. To aid continuity, elections are staggered, with half of the positions being available at two-year intervals and with provision for possible re-election if a member is re-nominated by their parent state. The elected members, themselves, elect Committee officers for a period of two years. These are the Committee Chairperson, three Vice-Chairpersons, and a Rapporteur. There is also the contingency to elect further Special Rapporteurs for specific named duties. The Committee is additionally provided with a Secretariat from the Secretary-General of the United Nations.

Although selected and nominated by a member’s state government, elected Committee members are deemed independent and serve their term in a personal capacity. To ensure political

impartiality in the Committee’s proceedings, Committee members cannot have any dealings with a periodic report sent from their parent state. They cannot also take part in any complaint made under an Optional Protocol that is directed against their state. They are also able to recuse themselves from participation in any issues they consider might lead to a charge of impartiality.

Monitoring Role of the UN Human Rights Committee

To meet their obligations from the Covenant, the Human Rights Committee has four basic monitoring functions to discharge (Neuman 2018):

1. To examine reports of the actions and processes taken by the member states (obligation Article 40) to give effect to the rights contained in the Covenant
2. To give high-level guidance regarding substantive and procedural obligations to assist member states to give effect to provisions in the Covenant
3. The evaluation of communications (complaints from individuals) made under the Optional Protocol against member states
4. Consideration of complaints regarding a lack of compliance to the provisions in the Covenant by a member state against another member state (Article 41)

Procedures Followed

Point 1 is a substantial overhead for the Human Rights Committee as each state that has either ratified or acceded to the Covenant has an obligation to provide an initial report within the first year of treaty membership (the core document) and, thereafter, a periodic report, typically every fourth or fifth year – or when required to do so by the Committee. Each report must explain how the state is addressing all Articles of the Covenant, in detail. The examination of the submitted report is achieved over two consecutive meetings of the Committee. In the first, the documentation is assignment to a Country Report Task Force comprising four to six Committee members. One member will be from the same geographic region as the submitting state, but no member can be from this state. In conjunction with the

Committee's Secretariat, and after due deliberation, a List of Issues is raised and sent to representatives of the submitting state. The submission is then examined in a public meeting with delegates of the state; this typically comprises the state's Ambassador to the United Nations Office at Geneva, senior representatives from their government, and other informed diplomats from the state. At the conclusion of this dialogue, the Country Report Task Force then drafts a report of the concluding observations that are initially circulated to all members of the Committee for their comments. It is then sent to the Committee for final discussion and adoption in a plenary session. This monitoring process provides visibility to the state's human rights compliance and can result in standardization and the adoption of "best practice" across member states (Shikhelman 2019).

Progression of a complaint made by an individual, group, or organization, under the first Optional Protocol (Point 3) requires the Committee to initially evaluate several admissibility criteria. These are specified in the Protocol and are a part of the jurisprudence underpinning the Committee. If the complaint is deemed admissible, the Committee will study the written submission by the appellant and any rejoinder the affected member state may provide and take a "View" regarding the substance and merits of the alleged violation. Should the Committee uphold the complaint, they provide a detailed remedy or appropriate recompense in their Views documentation. At present, the Committee's designated Special Rapporteur on Follow-up to Views would then liaises with all parties in an attempt to broker an agreeable outcome, given the Committee's findings, and to ensure instruments and/or suitable procedures are introduced to avoid reoccurrences by the offending State.

For point 4, should a member state raise a complaint against another party state claiming a lack of compliance due to negligence, disregard, or misinterpretation of the Covenant, in part or wholly, the states would be allowed a period of time, currently six months, to resolve the claim to the satisfaction of both parties. Should this remain unresolved, and the affected states have

both formally recognized the competence of the Committee to judge such disputes between party states, the Committee may formally consider the issues. This would require a referral by either or both states and for a reasonable period to have elapsed for a resolution, given the nature of the alleged transgression or transgressions. The Committee would then proceed to consider the dispute and seek a "friendly" resolution in the first instance. If this is not possible, an agreed reconciliation committee of five Committee members, independent of the states under dispute, would be instituted to consider the claims and to provide a formal report to the Committee Chair who would then forward this to the state parties within 12 months from the start of the investigation. Despite this provision, it is noteworthy that no such inter-state dispute has been formally progressed, to date.

Impact of the United Nations Human Rights Committee

The United Nations has a Human Rights Council (Hug and Lukacs 2014) whose role is to ensure that citizens are aware of their rights and know how to pursue these when denied them.

The United Nations Human Rights Committee, however, is charged with ensuring that the human rights Articles of the International Covenant on Civil and Political Rights are monitored. The outcome of this continuous process is to encourage states who have signed up or acceded to be members, to introduce and maintain domestic laws, policies, and practices that provide human rights for their citizens. The requirement of periodic reporting of compliance to the Covenant and the ready availability of the relevant documentation has the twofold effect of encouraging continued adherence by the state and an evolving process of harmonization of perceived best practices. The Committee actively engages in addressing those practices that limit or challenge human rights, both for the individual state and for the greater community. This has prompted changes in practices and policies and led to the introduction of appropriate human rights-focused legislation, by numerous party states (Heyns and Viljoen 2001).

Summary

The evolution of human rights and the Universal Declaration of Human Rights have been chronicled from their origins, in the Great Depression and the two World Wars, through to the offices of the United Nations. The Human Rights Committee is then shown to be the monitoring committee for compliance to the provisions of the United Nations International Covenant on Civil and Political Rights. The structure, composition, and remit of the Committee are further described, and indicative processes are detailed. Finally, their impact on the maintenance and furtherance of human rights is discussed.

ISAR

Definition

The United Nations Intergovernmental Working Group of Experts on International Standards of Accounting and Reporting (ISAR) is the United Nations focal point on accounting and corporate governance matters. Founded in 1982 by the United Nations Economic and Social Council, the ISAR aims to contribute to the economic and social development through the identification

good practices in corporate transparency and accountability. Nowadays, the activities made by the ISAR have been widely explored by academics and practitioners because of the increasing awareness about the need to favor the transition from traditional financial systems to modern economies based on the integration of social and economic goals. In this regard, the ISAR is considered by academics and practitioners as one of the leading institutions in the emerging field of the SDG reporting.

The Evolutionary Path of the ISAR

Since the 1982, the ISAR has been involved in many projects about accounting and accountability topics. The choice made by the United Nations to activate a research group to support the transition toward more transparent financial markets was driven by the need to enhance the comparability of the information disclosed by worldwide companies on mandatory or voluntary basis. In this regard, the United Nations organized a stable research group under the supervision of the United Nations Conference on Trade and Development (UNCTAD), which is the organizational body that coordinates ISAR activities.

Evaluating the main research focus of the ISAR is a complex task for academics. Over the year, the ISAR constantly revised their research activities in order to consider the contemporary challenges faced by worldwide companies. Accounting and SMEs, corporate governance and narrative disclosure are some of the main themes considered by the ISAR since its foundation. In particular, the main projects launched by the ISAR can be summarized by the following reports:

- 2003: *Accounting and Financial Reporting Guidelines for Small and Medium-Sized Enterprises (SMEGA) Level 3 Guidance*
- 2006: *Guidance on Good Practices in Corporate Governance Disclosure*
- 2008: *Guidance on Corporate Responsibility Indicators in Annual Reports*
- 2019: *Guidance on Core Indicators for Entity Reporting on Contribution Towards*

Implementation of the Sustainable Development Goals

In the last few years, the ISAR activities regarded nonfinancial dimension of accounting practices, as evidenced by the intense activities about social and environmental accounting. This paradigm shift is consistent with the original goal identified by the United Nations, which is the identification of initiatives to support the implementation of international standards, codes, and best practices to promote harmonization and improvement of quality of enterprise reporting to facilitate financial stability, international and domestic investment. Thus, the increasing awareness about the need to integrate sustainability topics in financial statements underlined the need for the ISAR to actively contribute to this debate through their project.

As evidenced in the previous section, in 2019, the ISAR launched its guidance on SDG reporting, which was a relevant contribution for companies and policy makers because of the lack of widely adopted guidelines about the disclosure of information about business contribution to the 2030 Agenda. In fact, the first evidences collected by academics revealed that the SDG reporting field was characterized by the coexistence of alternative practices based on different theoretical and practical foundations (García Meca & Martínez Ferrero, 2021; Pizzi et al., 2022). Thus, the attempt made by the United Nations to evaluate business contribution through the overall number of nonfinancial reports yearly disclosed by companies was not achieved because of these limitations (Venturelli et al., 2019). This evidence is also confirmed by the first insights collected about the Directive 2014/95/EU, which represents one of the main international initiatives developed to encourage companies to adopt more transparent and reliable information on mandatory basis.

The SDG Reporting According to the UNCTAD

Building on the SDG 12.6, which explicitly requires to the Member States to introduce

mandatory provisions about sustainability reporting, in 2019, the ISAR contributed to the launch of the official guidelines about SDG reporting. The main aim of the guidelines can be summarized by the need to identify a set of standardized metrics to enhance the comparability of the information reported by companies to communicate their contribution to the sustainable development goals. At the same time, the guidelines aim to support governments in their evaluation activities. In this regard, they represent a managerial tool with direct implications on policy making and decision processes.

The Guidance was prepared in accordance with the agreed conclusions of the 34 sessions of the ISAR, which in 2017 had requested UNCTAD to develop guidelines to support the disclosure of information about SDGs through the use of a limited number of sustainability indicators. This process was supported by preliminary reflections made by the ISAR during their periodical meetings. In particular, the projects about “eco-efficiency indicators for preparers” and “accounting for environmental costs and liabilities” are considered by the ISAR as two of the main pillars that have supported the development of the final version of the guidelines.

The main conceptual foundation of the standard consists of the provision of explicit reminder to the adoption of a reporting process inspired by typical approaches identified by accounting standards, such as the simplicity, baseline approach, emphasis on quantitative indicators, and alignment between the micro- and macro-level indicators. In particular, a central role is covered by the emphasis on quantitative indicators, which represented a limit for an effective representation of the main externalities related to business activities. Furthermore, the choice to consider internal and external perspectives has been driven by the need to consider the political dimension of the 2030 Agenda, which is a worldwide agreement between governments. In this regard, the disclosure of this information should represent relevant indicators also for policy makers interested to collect data from the private sector (Zhan & Santos-Paulino, 2021).

As regards the methodological approach, the guidelines suggested the adherence to the

following principles: materiality vs. universality, clarity of reporting boundaries, incremental approach, consistency in measurement methodology and data comparability, and reporting period. Some of these principles have been also considered by policy makers in their regulation activities (e.g., the materiality approach proposed by the European Commission) and by practitioners (e.g., the recent initiatives launched by the IFRS Foundation about comparability). However, the identification of this methodological approach represents an innovation within the sustainability reporting landscape, as evidenced by the absence of specific strict requirements about SDG reporting (Unerman et al., 2018).

Concluding Remarks

Accounting harmonization represents a critical issue for policy makers. In the last few years, the concept of accounting harmonization evolved from traditional financial reports to the emerging accounting tools adopted by worldwide companies to disclose their contributions to the sustainable development. Within this scenario, the ISAR can cover an enabling role in foster accountability processes. As evidenced by the long-term vision adopted by the United Nations in the 1982, the ISAR represents an effective tool to anticipate the future trends of accounting and accountability. The recent contribution to the development of the official UNCTAD guidelines about SDG reporting confirms this evidence. In this regard, management scholars interested to evaluate the main interlinkages between corporate communication and business strategy should try to embed the practical contribution provided by the ISAR within their research to fill the knowledge gap between theory and practice, which represents a critical issue for academics.

- 2019a). As a voluntary initiative with over 650 signatories worldwide, PRME is the largest organized association between the United Nations (UN) and management-related higher education institutions. PRME encourages business schools and management-related higher education institutions to become advocates for an inclusive and sustainable global economy by incorporating values of corporate social responsibility and sustainability into their activities, teaching, and research using the six principles framework. In summary, the PRME initiative:
- Provides a platform for dialogue and learning on responsible management education
 - Develops and publishes tools and resources to help increase responsible management education
 - Identifies and develops thought and action leadership on responsible management education

PRME engages business and management schools to ensure they provide future leaders with the skills needed to balance economic and sustainability goals, while drawing attention to the Sustainable Development Goals (SDGs) and aligning academic institutions with the work of the UN Global Compact (UNPRME 2019a; CEEMAN 2019). Academic institutions that are publicly recognized and are degree-granting, as well as corporate universities whose parent organizations are participants of the UN Global Compact, are eligible to become signatories to PRME (UNPRME 2019c).

United Nations Principles for Responsible Management Education

PRME

Description

The Principles for Responsible Management Education (PRME) is a United Nations-supported initiative. It was founded in 2007 with the goal “to raise the profile of sustainability in schools around the world, and to equip today’s business students with the understanding and ability to deliver change tomorrow” (UNPRME

Introduction

The social and environmental challenges we are facing today (e.g., poverty, substantial levels of inequalities, aging societies, climate change, finite resources, etc.) as well as numerous corporate scandals (e.g., the Volkswagen emissions scandal, the collapse of Enron due to cooked books, the spying on its board members and on the personal life of some of its investors of Deutsche Bank, etc.) and the global financial crisis have recently

led to an increased interest in corporate social responsibility (CSR). At the same time, some growing discontent with the way many business schools around the world teach their students and encourage a self-interested, profit-orientated focus that ignores the wider responsibilities of business to society can be observed (Baden 2013; Gorenak 2011; Kochan 2002; Mitroff 2004). Some scholars have started to look at the role business schools play in educating future business (and other) leaders and ask for changes in the business school curricula. Cant and Kulik (2009), for example, claim that “business schools would be remiss, if not unethical themselves, if their ethics education efforts were not increased in light of recent events.” Implicit in this debate is the desire that business education will equip students with the tools, skills, and motivation to recognize and repel unethical behavior in the workplace and to implement responsible and sustainable business practices (Baden 2013).

These developments were also observed by the United Nations (UN), and PRME is the UN Global Compact’s initiative which aims to transform management education, research, and thought leadership globally. The initiative is widely regarded as “an important catalyst for the transformation of management education (...) in order to meet the increasing societal demands for responsible business” (Godemann et al. 2014). To achieve this, PRME provides the six principles framework, supports the development of learning communities, and promotes awareness about the United Nations Sustainable Development Goals (SDGs) (UNPRME 2019a).

The Six Principles of PRME

Signatories to the PRME are required to commit to six principles when developing research, curricula, and teaching methodologies (Godemann et al. 2014). These principles of PRME are based on internationally accepted values endorsed by UN member states and provide an engagement framework for higher education institutions to embed responsibility and sustainability in education, research, and campus practices through a process

of continuous improvement (UNPRME 2019b). The six principles can be summarized as follows:

- **Principle 1: Purpose** – To develop the capabilities of students to be future generators of sustainable value for business and society at large and to work for an inclusive and sustainable global economy.
- **Principle 2: Values** – Participating institutions incorporate the values of global social responsibility as portrayed in international initiatives such as the United Nations Global Compact into their academic activities, curricula, and organizational practices.
- **Principle 3: Method** – Participating institutions create educational frameworks, materials, processes, and environments that enable effective learning experiences for responsible leadership.
- **Principle 4: Research** – Participating institutions engage in conceptual and empirical research that advances our understanding about the role, dynamics, and impact of corporations in the creation of sustainable social, environmental, and economic value.
- **Principle 5: Partnership** – Participating institutions interact with managers of business corporations to extend our knowledge of their challenges in meeting social and environmental responsibilities and to explore jointly effective approaches to meeting these challenges.
- **Principle 6: Dialogue** – Participating institutions facilitate and support dialogue and debate among educators, students, business, government, consumers, media, civil society organizations, and other interested groups and stakeholders on critical issues related to global social responsibility and sustainability (Source: UNPRME 2019b).

Progress and Achievements of PRME

The use of the PRME as a guide for delivering sustainability-focused management education has provided an opportunity to structure the change process of business schools and management-related higher education institutions

(Godemann et al. 2014). By some estimates, there are over 16,000 business and management programs worldwide, and a growing number of them are PRME signatories (UNPRME 2019c). Studies conducted on PRME found that management education institutions that signed up to the six principles initially concentrated on the development of new modules and programs which focus specifically on CSR, but by now, they are trying to embed responsibility topics into all undergraduate and postgraduate programs (Godemann et al. 2013).

[Global Goals](#)

Definition/Description

The Sustainable Development Goals (SDGs), also called the Global Goals, are the central part of the 2030 Agenda for Sustainable Development (UN 2020a). They comprise of a global agenda of 17 sustainability goals and 169 targets (Martinuzzi and Schönherr 2019) that were developed through a bottom-up and consultative approach. The goals were agreed to at a UN General Assembly in 2015 and signed by nearly 200 countries. They cover complex overlapping concepts (ending poverty and hunger, reducing the impacts of climate change, helping to develop sustainable cities and community, and cutting gender inequality, and wider general inequality) where the action in one area will impact on the outcomes of others (Walker et al. 2019a). It is a nonbinding legal treaty, but a global partnership with voluntary guidelines intended to work in the spirit of global solidarity (Pekmezovic 2019).

A critical success factor is the involvement of the private sector with other key stakeholders being governments and regulators (e.g., setting national targets taking national circumstances into consideration) and civil society philanthropic organizations. However, the SDGs ask for key changes in the global financial and economic system to bring about fundamental sustainability transformation (Walker et al. 2019a).

The History

After the end of the Second World War in 1945, the world was striving for world peace. Representatives of over 80% of the world population gathered. The world was ready for an organization to follow the League of Nations to pursue common global goals. In June 1945, 50 countries signed the Charter in San Francisco (Poland signed later as the 51st original member state), United States, to form a new organization, the United Nations. The UN came into existence on 24th October of the same year, when the majority of signatories had ratified the Charter (UN 2020b).

It has three main goals: securing world peace, enforcing human rights, and ensuring social justice in the world. By signing the Charter of the United Nations, the members of the organization are obliged to act in common interest and by the principles laid down in the Charter of the United Nations (Woyke 1998). In the current 111 articles, all principles, values, rules of action as well as the organizational structures, and the handling of all members of the United Nations are formed into 19 chapters. Today, the United Nations are a multilateral forum for international exchange. It is intended to promote relations between states. This cooperation shall support advancement in political fields, human rights, development, economics, and culture (United Nations 2015a), including fostering sustainable development and poverty reduction.

A pioneering idea toward sustainable development, including issues of security, human needs, freedom, and environment, was already addressed at the UN Conference in 1972 in Stockholm, Sweden. Following this, the Brundtland Report

was published in 1987 highlighting the importance of an integrated approach to peace, development, and the environment. The Earth Summit in Rio de Janeiro, Brazil in 1992, renewed that approach by adopting the Rio declaration comprising of 27 principles to guide global sustainable development (UN 2015a).

Consequently, a new global partnership, the Millennium Declaration was concluded in September 2000 at the Headquarters of the United Nations in New York, where eight mutual goals were formulated. Signed by 191 countries, the so-called Millennium Development Goals (MDG) aim to reduce poverty, to eliminate hunger, to achieve universal primary education, to promote gender equality and to empower women, to reduce mortality rate, to improve maternal health, to battle against HIV/AIDS, malaria, and other diseases, to ensure global environmental sustainability, and to facilitate global partnerships for development by 2015 (UN 2020c).

At a follow-up conference, the United Nations Conference on Sustainable Development in Rio de Janeiro, Brazil (Rio+20), in 2012, the importance of future global sustainability, including the importance of human rights, was highlighted. Additionally, there were talks on the post-MDGs world, leading to the first formal discussion of the Sustainable Development Goals (SDGs). It was followed by the process of establishing an inter-governmental process to implement the UN's sustainable development agenda and to develop global goals that are easy to communicate, concise, and action-oriented. Those goals, prepared as a proposal with a list of targets and measurable indicators, arose from a 30-member Open Working Group of the UN General Assembly. It provided the basis for developing the Agenda 2030 (Pekmezovic 2019).

In the final declaration of the Rio+20 conference with the title "The future we want," the main future global targets included sustainable development and a green economy. At that time, neither concrete goals were expressed, nor possible measurements determined (UN, 66/288. The future we want, 2012). Some years later, a more detailed report, "The Millennium Development Goals

Report 2015,” was published to highlight the achievements of the MDGs, in particular the reduction in global poverty levels. However, “Despite many successes, the poorest and most vulnerable people are being left behind” (UN 2015a) as many goals were not achieved. The results were included in the discussions for the Agenda 2030 (Gungadeen and Paul 2020). This new development Agenda 2030 is constructed on three key milestones: (1) adoption of SDGs to replace MDGs (concluded at a UN General Assembly in New York – Sustainable Development Goals); (2) a new framework for financing the development goals (the third international conference on financing for development in Addis Ababa – Addis Ababa Action Agenda); and (3) reaching a legally binding and universal agreement on climate (COP-21 in Paris – Paris Agreement) (Walker et al. 2019b).

Sustainable Development Goals (SDGs)

As part of the Agenda 2030, the SDGs are the latest in a line of global sustainable development initiatives going back to the UN Conference on the Human Environment held in Stockholm in 1972 (Wynn and Jones 2019). It was adopted by the UN at the United Nations Headquarters in New York, United States, in September 2015. All 193 member states representing industrialized countries, developing countries, and least developed countries agreed on the new Agenda “Transforming our World: The 2030 Agenda.” It is based on the three pillars of sustainable development (economic, social, and environmental).

In total, 17 goals and further 169 targets (broad goals with specific targets) to be achieved by 2030 were defined, designed to bring a variety of life-changing “zeros” such as zero poverty and hunger and zero discrimination against women. The focus is on global and long-term change, whereby global cooperation is a basic requisite. These new SDGs include the principles and commitments of the United Nations, including the full respect for international law (UN 2015a).

The cooperation of all nations is thereby essential to achieve the SDGs until 2030. It is evident

that this is a global challenge and that multilateral action by all parties is indispensable. Holistic solutions are needed to promote international cooperation and partnerships in important sectors like poverty reduction, climate change, migration, technology, and trade (UN 2019). Economically, for example, it is estimated that countries will need to deploy up to US\$4.5 trillion per year between 2015 and 2030 to meet the SDGs and the Addis Ababa Action Agenda (AAAA). However, in 2020, “the world is not on track to achieve the Global Goals” (UN 2020a, p. 3) and the mission of “Leave No One Behind” will be difficult to be achieved by 2030 (Kharas et al. 2018). Additionally, huge data gaps still exist in terms of geographic coverage, timeliness, and the level of disaggregation required. This situation is worsened by the COVID-19 crisis that began in January 2020 and impacted on all areas of the SDGs.

The 19 SDGs are the following:

GOAL 1 – NO POVERTY

End poverty in all its forms everywhere.

GOAL 2 – ZERO HUNGER

End hunger, achieve food security and improved nutrition, and promote sustainable agriculture.

GOAL 3 – GOOD HEALTH AND WELL-BEING

Ensure healthy lives and promote well-being for humans at all ages.

GOAL 4 – QUALITY EDUCATION

Ensure inclusive and equitable quality education and promote lifelong learning opportunities.

GOAL 5 – GENDER EQUALITY

Achieve gender equality and empower all women and girls.

GOAL 6 – CLEAN WATER AND SANITATION

Ensure availability and sustainable management of water and sanitation.

GOAL 7 – AFFORDABLE AND CLEAN ENERGY

Ensure access to affordable, reliable, sustainable, and modern energy.

GOAL 8 – DECENT WORK AND ECONOMIC GROWTH

Promote sustained, inclusive, and sustainable economic growth, full and productive employment, and decent work.

GOAL 9 – INDUSTRY, INNOVATION, AND INFRASTRUCTURE

Build resilient infrastructure, promote inclusive and sustainable industrialization, and foster innovation.

GOAL 10 – REDUCE INEQUALITIES

Reduce inequality within and among countries.

GOAL 11 – SUSTAINABLE CITIES AND COMMUNITIES

Make cities and human settlements inclusive, safe, resilient, and sustainable.

GOAL 12 – RESPONSIBLE CONSUMPTION AND PRODUCTION

Ensure sustainable consumption and production patterns.

GOAL 13 – CLIMATE ACTION

Take urgent action to combat climate change and its impacts.

GOAL 14 – LIFE BELOW WATER

Conserve and sustainably use the oceans, seas, and marine resources for sustainable development.

GOAL 15 – LIFE ON LAND

Protect, restore, and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse land degradation and halt biodiversity loss.

GOAL 16 – PEACE, JUSTICE, AND STRONG INSTITUTIONS

Promote peaceful and inclusive societies for sustainable development, provide access to justice for all, and build effective, accountable, and inclusive institutions at all levels.

GOAL 17 – PARTNERSHIPS FOR THE GOALS

Strengthen the means of implementation and revitalize the Global Partnership for Sustainable Development.

(UN 2015c)

Measurement

The progress in achieving the SDGs is measured by data collected at the global level from official sources (World Bank, WHO, ILO, and others) and

nonofficial data sources (research centers and nongovernmental organizations). They are used to analyze developments in the implementation of appropriate policies and the achievement of objectives. Indicators are used to critically record and evaluate the achievement of the SDGs. Accordingly, the development of countries can be compared to each other as well as the level of achievement of other global measures. Nevertheless, national and global data quality, especially adequacy and accuracy, remains difficult (Sach et al. 2019). Moreover, there are additional issues in integrated monitoring, review, and reporting mechanisms that are essential for the effective improvement to transmit information on the SDGs advancement. The results of the measurements can be found in the SDG-Index (<https://dashboards.sdgindex.org/rankings>).

Fazit and future

Various scenarios are imaginable as to whether the measures will achieve the global goals by 2030. The implementation of the goals is expected to be uneven in different countries, and it will be particularly challenging in regions that are affected by conflicts. Regardless of which scenario occurs by 2030, the reality is that an enormous increase in population is forecasted so that by 2050 almost ten billion people will live on the planet. As a result, individual goals must be pursued well beyond 2030 to provide people, especially those in the southern hemisphere, with fair and universal access to clean drinking water (Froehlich 2018).

Additionally, to the review of the 169 targets, recommendations were also developed based on the work of the independent Future Earth, the UNU-IAS Post-2015 project, and the Independent Research Forum. From a scientific perspective, there are visible improvements to be seen concerning the Millennium Development Goals. However, the extent to which the 17 goals have been developed and implemented is not consistent enough in itself. There is an overlap between the goals, and this could cause conflicts and therefore be unsustainable. To better specify the SDG,

suggestions for an integrated perspective are proposed. An SDG forum for scenario modelers could relieve the burden and promote the transfer of experience. This would provide national planners, policymakers, and stakeholders with simplified access to the data. It could also be used to stimulate research and to facilitate the creation of quantitative maps of the entire system based on the SDG. The Department of Economic and Social Affairs of the United Nation could be of assistance to create those. Furthermore, it is recommended to develop an open access online database to provide more specific information. In this way, sustainable development assessments could be compiled, and a common data standard could serve as a basis. Furthermore, policymakers could benefit much from a systematic data synthesis from different perspectives, based on assessments for specific SDGs and fully integrated SDG knowledge (UN 2015a).

The SDGs are part of a long-term process with the vision of “the future we want.” This statement, expressed at the Rio Conference in 2012 (Rio+20), derives from the 1987 Brundtland Report “Our common future.” To be able to achieve this vision including the 17 goals and 169 targets, global governance and stakeholder participation are indispensable. In addition to the ongoing process of implementation of and transformation through the SDGs, new trends such as climate change, digitization, urbanization, aging, and migration are emerging in parallel. As a consequence, society may have difficulties in adapting. Likewise, if individuals, nations, and cultures feel disadvantaged by conditions following the fulfillment of the legally not binding SDGs and their potential overburdening challenges, societies could show counterreactions. Accordingly, the SDGs are one of the most important challenges for the future of humanity to create a more equal sustainable human world by taking global actions (Kurz 2020).

Description

Gardens have become popular in educational institutions of all stages, as appropriate resources within the framework of a competence-based teaching-learning model. They provide students with

outdoor learning experiences, while promoting affective and cognitive development, and personal well-being. Gardens also provide experiences *in* and *of* nature, particularly when they are sustainably managed, that is, based on practices that mimic how nature works, so that the garden is, in fact, a healthy and resilient agro-ecosystem (*organic learning gardens*). In higher education, gardens are emerging as valuable spaces to address key issues of food and sustainability, and from which to promote critical thinking. In the context of the significant efforts devoted to conceptualizing competences in sustainability since the beginning of the twenty-first century, the GreenComp (The European Sustainability Competence Framework) has recently been defined. This framework is used here to propose the 17 specific sustainability competencies that can be promoted using university gardens. These correspond to the four areas established in the GreenComp: five relate to *embodying sustainability values*, three to *embracing complexity in sustainability*, four to *envisioning sustainable futures*, and five to *acting for sustainability*.

Introduction

Contemporary educational institutions, including universities, are planned built environments from which “nature” has been frequently excluded. When present, green spaces are professionally managed to be tidy and sanitized, thus not providing real experiences about what nature is like and how it works: the variety of insects that may inhabit a wild green patch, the variety of birds that feed on them, or on the worms that come to the surface after rain, for instance. Such spatial planning reflects the Enlightenment-informed distinction between what is “human” and what is “natural” that has brought us to where we are today (Milstein et al., 2019; Molina-Motos, 2019). However, a shift is occurring toward a generalized understanding that nature is essential in order to educate, and, consequently, its presence is necessary in educational institutions (Louv, 2005). First, direct experience *in* and *of* nature plays a vital role, arguably an irreplaceable

one, in affective and cognitive development (Khan & Kellert, 2002). Second, regular or frequent contact with nature has restorative psycho-emotional effects (Berman et al., 2008; Hartig et al., 2001; Kaplan & Kaplan, 1989). Moreover, it is important to provide threshold experiences that lead to a life of conservation (IUCN, 2016), since empirical evidence shows that direct experiences *in* and *of* nature are related to the development of affective relationships with it (the so-called *connectedness with nature*, a term coined in the field of environmental psychology), and subsequently, proenvironmental or pro-conservationist attitudes and behaviors (Chawla, 2009; Collado et al., 2013; Evans et al., 2018; Zelenski et al., 2015).

This recognition of the need to provide outdoor learning experiences in formal education marks an enormous step in legitimizing the presence of food gardens at educational institutions (Eugenio-Gozalbo et al., 2020). At such institutions, an important shift has occurred in recent years. While, some years ago, the initiation of a university garden was an obstacle-laden venture, gardens are now recognized as significant sustainability projects and, in many cases, are promoted from university sustainability offices (Murakami, 2016; Ostertag et al., 2019). University gardens are sometimes initiated and managed by students themselves and bring together diverse stakeholders from the campus and the wider community (Duram & Williams, 2015; Jagger et al., 2016). In other cases, they are carefully designed and purposely managed by the institution for sustainability education (Cheang et al., 2017). Between these two situations, there are various other possibilities, such as gardens devoted to outdoor science education in Education Faculties (Eugenio-Gozalbo & Ortega-Cubero, *in press*; Eugenio-Gozalbo et al., *in press*). Overall, university gardens are helping provide students with learning experiences on food and sustainability, and to promote critical thinking (Barlett, 2011; LaCharite, 2016; Eugenio-Gozalbo et al., 2021).

In Spain, university garden-based learning (GBL) practitioners coined the term *organic learning gardens* (OLGs), to underline that education – and not production – is the main

function of university gardens, and that sustainable farming practices are implemented in them (Eugenio-Gozalbo et al., 2020). The sustainable management of these spaces involves important practices, such as composting and vermicomposting organic waste, mulching, associating plants, and avoiding biocides and fertilizers, among others. These are important, first, to promote respect and care toward life and nature in students, and, second, because such techniques are often *nature-based*, in that they imitate the way nature works, thus resulting in more diverse, complex, functional, and resilient agro-ecosystems (Laureto et al., 2015; Carmona et al., 2016), which in turn are more valuable as resources to teach topics in the fields of ecology or environmental sciences. For example, at small spatial scales, the diversity of insects can be predicted from that of plants (Southwood et al., 1979), and the spatial complexity in the distribution of plants is also important for bees (Jha & Vandermeer, 2010); these kinds of aspects are considered and promoted by sustainable agriculture, but not by conventional agriculture.

The use of OLGs as educational contexts (*garden-based learning*, Desmond et al., 2004) can mobilize the cognitive, procedural, attitudinal, and relational dimensions of learning and is thus considered a suitable strategy in the frame of the current educational model for European Higher Education, which is based on *teaching and learning by competences* (Lisbon European Council, 2000). The concept of competence was introduced in the field of linguistics by Chomsky (1965), from which it extended to other disciplines. However, there are many definitions and interpretations of the term, which generates some confusion. Internationally, competences are equated to *learning outcomes* (Cedefop., 2017), following the tendency to understand competencies as a transformation of objectives, which in fact moves away from the intended holistic approach. Competences have also been interpreted as an evolution of the four pillars posed by the Delors Report: learning to know, learning to do, learning to be, and learning to be together (Delors, 1996), which constitute an integrated approach to learning throughout life. This

approach had a significant impact on policy debates, teacher training, and curriculum development in a range of countries worldwide.

Two international organizations have contributed most to the concept of competencies, serving as the foundation for the current European Reference Framework: the Organization for Economic Cooperation and Development (OECD), and the United Nations Educational, Scientific and Cultural Organization (UNESCO). Thus, an outstanding definition of competences is that originally provided in the document Definition and Selection of Competencies (DeSeCo) in 1997 (Rychen & Salganik, 2003), and later reformulated as “the ability to successfully meet individual and social demands, or to carry out an activity or task” (OECD, 2003, p.8). The relevance of this perspective lies in the functional approach to performance based on the simultaneous development of knowledge, skills,

strategies, and metacognitions. From the European Union, competence development is being promoted from early ages and throughout life (EC, n.d.). In accordance with the guidelines proposed by the OECD and UNESCO, competences present seven characteristics (Fig. 1).

The structure of a competence consists of three essential parts that allow it to be defined as follows (Cedefop., 2017):

- *Action*: observable in an activity that can be evidenced in the form of performance. The verb will be in the infinitive or present indicative.
- *Object*: on what or whom the action falls. Questions such as what, why, and where? can be asked.
- *Context*: performance condition where it is applied, with which the quality of performance achievement is expressed.

University Gardens for Sustainable Development, Fig. 1 Characteristics of a competence, according to the proposals of the EU, the OECD, and UNESCO

For example, “to apply (*action*) the procedures that govern nature (*object*) to guarantee a correct behavior for sustainability in daily life (*context*).”

Currently, there are four documents that serve as a reference in the European competence framework: (1) The Digital Competence Framework for Citizens (DigComp) (Carretero Gómez et al., 2017), updated to DigComp 2.2. (Vuorikari et al., 2022); (2) The European Entrepreneurship Competence Framework (EntreComp) (Bacigalupo et al., 2016); (3) The European Framework for Personal, Social and Learning to Learn Key Competence (LifeComp) (Sala et al., 2020); and (4) The European Sustainability Competence Framework (GreenComp) (Bianchi et al., 2022). This last one, the GreenComp, is the document that will serve as the basis to define the sustainability competences that can be specifically addressed using OLGs, which constitutes the main objective of this entry.

Review of the Literature on Competences in Sustainability

Since the beginning of the twenty-first century, significant efforts have been devoted to conceptualizing *competences in sustainability*, understood as the holistic capacities that citizens need to develop to deal with sustainability challenges (De Haan, 2010; Barth, 2015; Willard et al., 2010). The first ambitious effort to systematically and comprehensively organise these competences in a conceptually embedded set of interlinked competences was conducted by Wiek et al. (2011a, b), in a work that synthesized the previous literature on sustainability competencies into an overarching framework. Their compilation showed a rich picture of key competences in sustainability, differing, however, in terminology and corresponding to a variety of frameworks unrelated to a common core concept. The competences compiled were *systems-thinking competence*, *anticipatory competence*, *normative competence*, *strategic competence*, and *interpersonal competence*, and each of these was related to a series of concepts, for example, *systems-thinking competence* was related to: (1) variables/indicators, subsystems, structures,

and functions; (2) feedback loops, complex cause-effect chains, cascading effects, inertia, tipping points, legacy, resilience, adaptation, and structuration; (3) across/multiple scales: local to global; (4) across/multiple/coupled domains: society, environment, economy, and technology; and (5) people and social systems: values, preferences, needs, perceptions, (collective) actions, decisions, power, tactics, politics, and institutions. Wiek et al. (2016) subsequently updated their framework by adding a sixth competence, named *integrated problem-solving competence*.

Efforts were also made by the United Nations Economic Commission to provide a framework of *core competences in Education for Sustainable Development* (ESD) for educators, clustered around three essential characteristics of ESD: *holistic approach*, *envisioning change*, and *achieving transformation*. This document established what educators “should know, what they should be able to do, how they should live and work with others, and what they should be like” if they are to contribute to ESD (UNECE, 2012). For instance, “The educator is someone who is inclusive of different disciplines, cultures and perspectives, including indigenous knowledge and worldviews” (pp. 14–15). This competence is related to what an educator is like, understanding that it is necessary to develop a holistic vision, integrating thought and practice.

In 2014, UNESCO defined four core competencies in sustainability: *critical thinking*, *systemic thinking*, *collaborative decision-making*, and *taking responsibility for present and future generations* (UNESCO, 2014, p. 12). Importantly, this document highlighted ESD pedagogies, moving from transmissive teaching and memorization toward new approaches to teaching and learning that go beyond the classroom and into the community, thus being in line with the use of OLGs, or garden-based learning. When respondents to UNESCO’s Global Monitoring and Evaluation Questionnaire were asked to choose from a list of the types of teaching and learning strategies favored in the implementation of ESD, the top five types of learning were *participatory and collaborative learning* (87%), *problem-based learning* (84%), *critical thinking* (81%), *discovery*

learning (76%), and *interdisciplinary learning* (73%). Also important were *multiple stakeholder social learning* (66%), *systems- thinking-based learning* (61%), *transmissive learning* (56%), and *disciplinary learning* (50%).

Rieckmann (2018) subsequently conducted a review of the previous literature considering, among others:

- The three categories of key competences of OECD: *using tools interactively*, *interacting in heterogeneous groups*, and *acting autonomously* (Rychen, 2003).
- The eleven competences of *gestaltungs-kompetenz* (shaping competencies), for example, *thinking and acting in a forward-looking manner*, or *showing empathy for, and solidarity with, the disadvantaged* (De Haan, 2010).
- The four competence-based dimensions of sustainability: *the dynamics and content of sustainability*, *the critical dimension of sustainability*, *the change and innovation dimension of sustainability*, and *the existential and normative dimension of sustainability* (Wals, 2015).
- The five additional key competences of Glasser and Hirsh (2016): *affinity for life*, *knowledge about the state of the planet*, *wise decision-making*, *modeling sustainable behavior*, and *transformative social change*.

He finally highlighted the mutually interdependent competencies on which there was general agreement within the international ESD discourse, which are the following:

1. Systems-thinking competence.
2. Anticipatory competence.
3. Normative competence.
4. Strategic competence.
5. Collaboration competence.
6. Critical thinking competence.
7. Self-awareness competence.
8. Integrated problem-solving competence.

The most recent effort to define and compile sustainability competences is that of the GreenComp (The European sustainability

competence framework) (Bianchi et al., 2022), which will be used in this work to define sustainability competences that are promoted in the context of educational gardens and, in particular, of university gardens. It is composed of four areas, each one comprising three competences that are explained by means of descriptors (Bianchi et al., 2022, pp. 14-15):

1. Embodying Sustainability Values
 - 1.1. **Valuing sustainability:** to reflect on personal values, to identify and explain how values vary among people and over time, while critically evaluating how they align with sustainability values.
 - 1.2. **Supporting fairness:** to support equity and justice for current and future generations and learn from previous generations for sustainability.
 - 1.3. **Promoting nature:** to acknowledge that humans are part of nature, and to respect the needs and rights of other species and of nature itself in order to restore and regenerate healthy and resilient ecosystems.
2. Embracing Complexity in Sustainability
 - 2.1. **Systems thinking:** to approach a sustainability problem from all sides, to consider time, space, and context in order to understand how elements interact within and between systems.
 - 2.2. **Critical thinking:** to assess information and arguments, identify assumptions, challenge the status quo, and reflect on how personal, social, and cultural backgrounds influence thinking and conclusions.
 - 2.3. **Problem framing:** to formulate current or potential challenges as a sustainability problem in terms of difficulty, people involved, time and geographical scope, to identify suitable approaches to anticipating and preventing problems, and to mitigating and adapting to already existing problems.
3. Envisioning Sustainable Futures
 - 3.1. **Futures literacy:** to envision alternative sustainable futures by imagining and

developing alternative scenarios and identifying the steps needed to achieve a preferred sustainable future.

- 3.2. **Adaptability:** to manage transitions and challenges in complex sustainability situations and make decisions related to the future in the face of uncertainty, ambiguity, and risk.
- 3.3. **Exploratory thinking:** to adopt a relational way of thinking by exploring and linking different disciplines, using creativity and experimentation with novel ideas or methods.
4. Acting for Sustainability
 - 4.1. **Political agency:** to navigate the political system, identify political responsibility and accountability for unsustainable behavior, and demand effective policies for sustainability.
 - 4.2. **Collective action:** to act for change in collaboration with others.
 - 4.3. **Individual initiative:** to identify own potential for sustainability and to actively contribute to improving prospects for the community and the planet.

Competences in Sustainability to Be Promoted Using University Gardens

Based on the GreenComp (Bianchi et al., 2022), four competences that can be promoted using instructional gardens are presented, classified into the same four areas:

1. *Embodying sustainability values.*

- To reflect on one's own values and practices in relation to garden management, and critically evaluate those of past and present generations, to finally identify the values and practices that are aligned with sustainability (*valuing sustainability*).
- To value the knowledge, time, and effort involved in sustainable food production, to support purchasing decisions that are responsible toward farmers and the planet (*supporting fairness*).

- To develop connection to nature in the garden, to generate behaviors of respect toward the needs and rights of other species and of nature itself (*promoting nature*).
- To value the natural resources that human societies need to feed themselves, with the aim of preserving healthy and resilient ecosystems for current and future generations (*promoting nature and supporting fairness*).
- To become aware of the impact that agricultural management decisions have on the physical-chemical environment and living beings, in order to restore and regenerate healthy and resilient ecosystems and sustain current and future human societies (*valuing sustainability, promoting nature, and supporting fairness*).

2. *Embracing complexity in sustainability.*

- To understand the garden as a system made up of components among which complex relationships are established, so that environmental factors or agricultural practices that affect one of such factors have repercussions on others and on the system (*systems thinking*) [to make management decisions on the agricultural practices capable of restoring and regenerating healthy and resilient ecosystems (*promoting nature*)].
- To evaluate evidence of the socio-environmental impacts of the agri-food system in order to challenge the *status quo* based on the experience of organically cultivating food for self-consumption (*critical thinking*).
- To formulate current or potential challenges related to sustainable resource management in the garden, in order to identify suitable approaches to mitigating and adapting or anticipating and preventing (*problem framing*).

3. *Envisioning sustainable futures.*

- To envision alternative future scenarios where sustainable farming practices are prevailing, and local communities have achieved suitable levels of alimentary self-sufficiency (*futures literacy*).

- To be capable of making sustainable garden management decisions, anticipating, and taking into account the uncertainties and risks derived from climate change or related to resource availability, with the aim of promoting food security (*adaptability*).
 - To be able to make responsible food consumption decisions, based on a critical attitude toward the current agri-food system in a context of uncertainties and risks across the planet (*adaptability*).
 - To be capable of developing innovative solutions to problems or challenges that occur in the garden in a context of climatic uncertainty and risks, through interaction and contributions from various disciplines (*exploratory thinking*).
4. *Acting for sustainability.*
- To demand campaigns and regulations to promote both sustainable food production and consumption (*political agency*).
 - To participate in social movements that favor both individual and corporate social responsibility for sustainability, with the aim of provoking shifts in society (*collective action*).
 - To identify one's own potential to sustainably produce food for self-sufficiency, thus contributing to one's health and to a sustainable planet (*individual initiative*).
 - To develop purchasing habits and food consumption habits that contribute to improving prospects for the community and the planet (*individual initiative*).
 - To interact and collaborate with others to manage the garden more efficiently, thus obtaining quality, seasonal, and local food (*individual initiative* and *collective action*).

Whereas some of these competences are developed merely by having the experience of gardening with colleagues or classmates in an organically managed space, the literature has pointed to the desirability of adopting a values-based pedagogical approach, meaning that explicit attention is paid to the values that (1) underpin different agricultural and food systems and their governance, (2) inform and shape

educational strategies and experiences, and (3) are held by different individuals in various encounters in the learning environment (Galt et al., 2012). All the competences proposed herein have the intention to “enable and empower students to become effective in positively contributing to sustainability problem-solving in their lives, professions, and communities” (Brundiers et al., 2021). As Sterling (1996 as cited in Sterling, 2017) suggested:

Whether the future holds breakdown or breakthrough scenarios . . . people will require flexibility, resilience, creativity, participative skills, competence, material restraint and a sense of responsibility and transpersonal ethics to handle transition and provide mutual support. Indeed, an education oriented towards nurturing these qualities would help determine a positive and hopeful breakthrough future. (p. 26)

University gardens are valuable resources for educators to deal with this challenge, since, by engaging people in the collective formation of scenarios for sustainable lifestyles that are accessible and relevant, education in responsible living is promoted, and democratic participation in social change empowered (Lenglet, 2015).

University Social Responsibility

T. Hande Arbak

Agate for Trade International Ltd., Izmir, Turkey

Synonyms

Higher education social responsibility; Social responsibility education

Definition

In general, education has a significant impact on individuals to develop themselves and thus to contribute to social relations, economic efficiency, and being a responsible citizen (Varış, 1991). Education system has a significant role, and organizations within this system lead to create and disseminate knowledge from corporate to societal level, and contribute to raising the rate of well-

being of the community (Wigmore-Álvarez & Ruiz-Lozano, 2012). Considering the importance of education, in particular higher education, the questions on the purpose and primary missions of the universities, then based on this, the scope of the university education, and the course offerings are under debate (Toker et al., 2016). Accordingly, from one point of view the most important task of universities is to focus on education, science, and applied research (Reed, 2004), while another view emphasizes the social consciousness of university students and graduating responsible citizens instead of technicians (Wilhite & Silver, 2005). Based on the argument that universities can perform these two tasks at the same time (Toker et al., 2016), two divergent views have reached a reconciliation with the concept of university social responsibility (USR) as a new paradigm in higher education. Then, USR refers to a four-dimensional set of principles including management, teaching, research, and extension. More specifically, it contains the efforts for the creation and transmission of knowledge based upon ethical principles, good governance, respect for the environment, and social engagement (Giuffré & Ratto, 2014, p. 233).

Corporate Social Responsibility

Corporate social responsibility has been in research and managerial agenda since the 1950s after the publication of Bowen's (1953) well-known work titled as "Social Responsibilities of Businessmen" and now seems to be a significant aspect of contemporary business activities (Kotler & Keller, 2008). Although the concept has taken a great deal of interest in different disciplines of social sciences, there is no common and agreed definition of the concept. However, Carroll's conceptualization and pyramid including the economic, legal, ethical, and discretionary (or philanthropic) expectations of society at a particular time has been widely recognized (Carroll, 1979, 1991). Turker (2019) states that as CSR is a dynamic concept, it is stated that the notion and the understanding of CSR has been developed

and evolved since the term was initially coined. Accordingly, in the 1950s, the main emphasis was related to doing good for society as an organizational responsibility. The 1960s is the period when the ethical obligations were on the agenda. In parallel to the awareness of the importance of organizational stakeholders, the notion of CSR has shifted to generate mutual benefits for both the organization and its stakeholders from the beginning of the 1970s. After this, CSR has become a strategic concept that creates and enhances value (Turker, 2019). Due to the strategic nature of CSR, it has been managed, discussed, and taught with an increasing interest both in academic and business fields.

University Social Responsibility

As a response to global economic, political, and social changes in recent years, to meet the societal challenges, universities, like many other sectors, also recognized the necessity to engage in the social responsibility practices in their course offerings and their strategic plans, and management processes (Larrán Jorge & Andrades Peña, 2017). Based on this, in 2007, the United Nations Global Compact has launched a framework for business and management schools revealing the Principles for Responsible Management Education that promote change within higher education institutions with the purpose of preparing responsible management professions for business (Burchell et al., 2015). Moreover, the European higher education area has been introduced by the Bologna Process. The Bologna Process that promotes reforms in innovation, quality of learning, and within 48 participating countries also focuses on developing social values in European universities and integrating social issues into the curriculum (European Commission, 2022).

In literature, how social responsibility has been incorporated as part of the curriculum is a research topic, and it is stated that social responsibility is lectured under several topics such as business ethics, corporate responsibility, corporate governance, social accountability, business,

and sustainability (Murphy et al., 2012, p. 314). The ultimate purpose of these courses is to nurture socially responsible citizens through promoting social and ethical values with the awareness of sustainability objectives. Moreover, it is recognized that the universities have a general task of training the professionals and leaders of the future, and additionally, they have a social role to prepare students for external social reality and to make knowledge accessible to all (Giuffré & Ratto, 2014). Thus, the university has a challenging mission to be useful to society, and this mission comprises a particular emphasis on content, attitudes, and values, to fulfill the requirements of excellence, ethical principles together with social values, and humanistic aspects of the generations. In order to assess the needs of the society, suggest alternative solutions to the existing issues, and promote development, universities have fundamental duties regarding socially responsible administration, corporate governance, effective and efficient management in addition to focus on teaching, engaging in research, generation and transmission of knowledge, and integrating with both local and global community. Consequently, universities need to design research and course offerings, by incorporating it into their mission, vision, corporate values, and strategy to fulfill their fundamental role regarding social responsibility (Wigmore-Álvarez & Ruiz-Lozano, 2012).

Being aware of social responsibilities also means corporate social responsibility for institutions and is related to developing strategies with this awareness. Among the external stakeholders of universities, students, alumni, and society, it is an important strategy to be able to meet the expectations of its internal stakeholders, such as administrators, faculty members, and staff, and to carry out responsible activities toward them. Therefore, university social responsibility covers social, environmental, and economic issues that should always be a part of their strategic planning and operation, while guiding how universities interact with both internal and external stakeholders and society (Chen et al., 2015).

Under these circumstances, enhancing individuals' awareness in society starts from not only

ideally but also physically at the university. As a part of organizational learning, efforts to reduce waste, preserve ecology, and efficiently consume resources on campus strengthen collaboration between the students and university members including both academic and administrative staff and enable spreading USR through the campus-wide sustainability initiatives. Consequently, the campus-wide sustainability efforts encourage student appreciation on the responsibilities and proactiveness for global issues and, thus, generate extension of USR (Wigmore-Álvarez & Ruiz-Lozano, 2012).

Conclusion

Based on the literature, USR is a new paradigm as a response to challenges of the recent decades and knowledge society. Being a part of the society, universities and other higher education institutions are also social actors that are required to act and work to promote knowledge transmission to the society, which desires a global sustainable development, within ethical principles. The concept of USR is an open field and is generally applied within the framework of quality management and accreditation so that their practices need to accomplish the accreditation and quality management at standards (Giuffré & Ratto, 2014, p.236).

Unknown Stakeholders

Katia Giusepponi

Department of Education, Cultural Heritage and Tourism, University of Macerata, Macerata, Italy

Synonyms

Invisible stakeholders

Definition

Unknown stakeholders have interests in the organization's activity, are influenced by its impacts, but do not have voice to participate in it, and sometimes they do not even have the maturity or the cultural context to realize and understand this influence.

They could be, for instance: entire peoples unaware of choices made by governments or businesses which will impact their well-being; consumers within the context of not being able to access sensitive, impactful information of the products and business; babies “who will breathe what will be left of the air seventy years from now” (D’Anselmi 2011, p. 52); Alzheimer’s patients living in a center whose management changes are being decided by the public administration (Bartlett and O’Connor 2010); all non-human creatures (Starik 1995). At the same time, other cases can be observed in workers who are in contexts that do not allow them to speak and hence do not guarantee them freedom of expression, and in individuals who, even if deeply understanding of the phenomena and their risks, do not deal with them because they do not believe in life and future.

Factors of Stakeholder Invisibility

From the previous brief examples, how the invisibility of the stakeholders derives from limits may be deduced:

1. In the *accessibility* of relevant information on the operations and impacts of the organization: the less elevated the sustainability culture of a community, the more restricted are its information resources (provided directly by the organization itself and indirectly by other actors) and channels to access them.
2. In the *cognitive attitude*, hence in the ability to rationally evaluate and understand the phenomena: this limit is linked to intellectual immaturity or degeneration (due to young age, illnesses, traumas, and so on); only when the availability of information meets this understanding are knowledge and learning generated.
3. In the *motivation*, that is in the willingness of individuals to apply the acquired knowledge to hinder harmful phenomena and promote positive behaviors; for this to happen, it is essential that evaluation and learning also involve emotional and affective elements, based on the individual’s value system: this depends strongly on the whole psychology of the person and, as mentioned above, on the shared sustainability culture.
4. In the *availability of space* to express points of view and issues: this limit could be objective (when there is no opportunity to speak and be listened to) or subjectively linked to psychological constraints, for example, the fear of losing something as a consequence to social commitment.

An unknown interlocutor category presents one or more of the above-indicated limits. All but those concerning the cognitive attitude – as here defined – are *directly* influenced by the economic, social, and ecological sustainability culture. It should be noted, however, that the issues in cognitive attitude, as factors of stakeholder invisibility, are influenced by the cultural context *indirectly*. In fact, the latter influences the adequacy/inadequacy of the solidarity environment and therefore the ability/inability of the social actors to give a voice to individuals with such issues (Fig. 1). In understanding the observed phenomenon, the important impact of emotional elements

Unknown Stakeholders,

Fig. 1 Factors of stakeholder's invisibility. (Source: Own elaboration)

on individual attitudes and behaviors must not be neglected; in particular in addressing persuasion strategies aimed at promoting stakeholder visibility, it is fundamental to keep in mind that external rational input cannot adequately relate to the person's affective component, just as external emotional input cannot adequately relate to the person's cognitive component (Millar and Tesser 1986; Crites et al. 1994; Nisbet and Zelenski 2011).

Toward the Inclusion of Unknown Stakeholders

The evolution of sensitivity to sustainability issues has often occurred, thanks to the impact on public opinion of important global players. For example, nonprofit organizations have globally played an extremely important role in the evolution of awareness regarding the problem of child labor and other issues of labor exploitation. They have also provided a significant contribution to the evolution of awareness regarding the risky use of toxic elements in food, clothing, and other goods. All of these are very important actions in

favor of the visibility of the stakeholders, because they bring to light information on sustainability issues, influencing common value systems, developing a sense of belonging to the global community, and supporting efforts to gain space of expression and claim.

Despite important developments such as those outlined above, the landscape of the invisible stakeholders is immense, and the spread of sustainability culture is still only initial and embryonic. This culture, in fact, requires the demanding transition of all the involved actors to an inclusive dimension of responsibility, which must take into account the needs of each stakeholder category in order to mediate them in an ethical perspective of global regeneration and well-being that must overcome conflict of interests (Thabrew et al. 2009; Fischer 1991; Glicken 2000). A dialogic approach to stakeholder management necessarily requires the development of an ethic of care and citizenship (Sama et al. 2004; Castello and Lozano 2009; Manville and Ober 2003). In an increasingly interconnected world, this ethical perspective is the key tool for a holistic approach to all – known and unknown – stakeholders, who include in a wide sense, as defined by Freeman

and Reed: “Any identifiable group or individual who can affect the achievement of an organization’s objectives or who is affected by the achievement of an organization’s objectives” (1983, p. 91; see also Evan and Freeman 1988).

It is true that for companies and other organizations, it is not easy to understand the needs of unknown stakeholders (Yang et al. 2009, p. 337; Reed et al. 2009). However, the general reference to sustainability and regeneration policies certainly supports the holistic vision indicated above and allows even less known stakeholders to be, although indirectly and not fully, considered in the decision-making process (Campbell et al. 2011, p. 326). Each organization therefore has the responsibility to not exploit or encourage this invisibility but act to reduce it and help to develop the cultural context outlined above. It should also be noted that, in a world that increasingly acts through the Internet, an important challenge is undoubtedly also that of discovering stakeholders on virtual environments and social media (Sedereviciute and Valentini 2011).

It is essential to highlight that the company should go beyond just discovering the hidden interlocutors and their unknown values. It should also ensure that such interlocutors are given adequate space and that they are represented by suitable individuals or institutions when they cannot directly interact (see, for instance, all the living creatures of the animal kingdom). The normative power of stakeholder theory – amply highlighted by Donaldson and Preston (1995) – is not enabled when the consideration of the needs of silent stakeholders is lacking (Kurland and Calton 1996, p. 23; Van Buren and Greenwood 2009).

Making efforts to bring unknown stakeholders and values to light means developing enormous awareness potential (D’Anselmi et al. 2017). The latter must be strategically inserted within an integrated development process, from the economic, social, and ecological perspectives. However, such development requires not only observing but also proactively listening to the parties and integrating the development of competitiveness, interlocutors’ trust, and social culture in a virtuous circle.

Utilitarianism

Milan Todorovic
Guildhall School of Business and Law, London
Metropolitan University, London, UK

Synonyms

Benefit focus; Opportunity ethics; Outcomes-focused practice; Rule of common good

Definition

Utilitarianism is a practical philosophy which continues to be influencing the principles of law, governance, politics, (political) economy, and societal structuring. A number of authors consider it inextricably linked to the very functioning of modern capitalism. The subject matter of *utilitarian* thought is convoluted: many thinkers have been labeled “utilitarian” though very few truly are. Utilitarianism survives well into the twenty-first century, and it remains relevant in both practical and philosophical terms; it underwent many mutations, and there are a number of contemporary schools of thought that seem attuned to it for the foreseeable future. Indeed, some radical forms of utilitarian thinking may continue to influence human civilization for the foreseeable future.

Utilitarianism may be defined as the modern *consequentialist* doctrine of *achieving the greatest possible happiness for the greatest numbers possible* – and in latter forms of utilitarianism, aiming for *the highest quality of such happiness attainable*. In its very initial original form, *utilitarian* thought was characterized by a more radical form and had combined liberty with elements of coercive control best epitomized in the *Panopticon*, a concept of some relevance to

contemporary societies (This is not only in terms of the self-evident application in “surveillance-driven societal norms,” as was contentiously proposed in Foucauldian thought. Panopticon and its assertion on the governance by public opinion, transparency, and related concepts are more logically contemporaneous to the manifest practices of the twenty-first than those of the late eighteenth century, as shall be seen further in this text). The immediate modification of its initial earliest form of act utilitarianism and rule utilitarianism simplifies and systematizes the matter; it also sets a number of individualistic principles curbing the power of governance mechanisms. Such pragmatic approach to the matter made utilitarianism more logically robust and defensible against very early critics who identified internal contradictions within it. As such, it has led to increased tolerant attitudes and law reform that enables greater degrees of legal equality and more humane punitive systems than those of its time. On the other hand, some argued that certain analytical flaws within its propositions have led to kinds of relativization with adverse impact on practical applications of everyday life. Those include commercial inequalities reflected in corporate behavior toward multiple stakeholder groups; economic stratification of healthcare provision and the infamous postcode lotteries in health and education; and others.

At the start of the twenty-first century, utilitarian thought and practice has various forms. This includes neo-utilitarian approaches that utilize cognitive psychology and work to enhance for practice relatively recent critical concepts such as normative stakeholder theory; contemporary forms of preference utilitarianism; and some more radical negative utilitarian ideas as well. Also, as seen across news media and permeating developed economies with strong civil societies, novel and powerful ethics of social advocacy in veganism and environmentalism (“extinction rebellion”) are taking root much thanks to utilitarian premises many of them are founded on. There are exceptions, as will be seen; some vegan and environmentalist thought is deontological or virtue-ethics based. At a time when religious ethics are on the wane in developed economies,

mindfulness takes over as a utilitarian concept (Brazier 2016).

Introduction: Origins

Two pivotal names in utilitarianism are Jeremy Bentham and John Stuart Mill. The latter had claimed that utilitarianism may find its roots in the works of Aristotle and can be traced to the religious ethics of Christianity (Contemporary critics tend to agree this is not the case. As for religious apologetics in Mill's work, it may be argued this is the condition of the broad consensus of the nineteenth century, an unlikely requirement of modern secular societies largely influenced by his, implicitly if not explicitly, secularist thought). This, while Eudaimonia ("goodness of spirit," synonymous with happiness) was indeed an aspect of Aristotle's work, with quite a few differences. In Aristotle's view, Eudaimonia is subject to matters of chance, including the respective birth rights (or lack thereof) of Greek citizens, women, and slaves; utilitarian concept of happiness may not be so – and Mill was decidedly egalitarian in those respects and in ways which would be alien to an ancient citizen of Athens (Ryan et al. 1987). Relatedly, the "natural rights" Mill so strongly rejected in the work of deontological ethicists like Kant does appear to underpin the work of Aristotle. Also, the virtue of Eudaimonia is not identical to the higher pleasures of Mill's thought, albeit related to some extent (In calling upon such towering authorities of ancient times highly revered in his day, Mill may have sought justification of his thought, perhaps a reference to the truth of his own work). One clearer connection with Aristotle was the teleological nature of his thinking, namely, the implications and validity of the method by which a result is arrived at. More directly inspiring to his predecessor and mentor Bentham was the work of Hedonists, namely, Epicurus. Proto-utilitarian thought may also be found in the oeuvres of Hume (in terms of logic) and Austin (save for his clearly non-secular approach to ontological matters). An important methodological influence on Mill was Bacon and the concept of *axiomata media* ("middle

principles"). This too was an aspect of Bentham's the original work on hedonic utility that Mill readily acknowledged in his otherwise considerable critique.

Though the overall impact of Bentham's and Mill's work can be seen to include a pragmatic tolerance of fringe behaviors and systematic review of the rigid values of their time both of which have been inherited in a number of legal and political systems present today, it would be naïve to approach them as proponents of what would today be described "democratic." Bentham's lack of empathy for prisoners or others subdued is manifest in his well-known quote "*Call them soldiers, call them monks, call them machines: so they were but happy ones, I should not care*" (Bentham 1995: 31). Similarly, the reference in Mill's work to *higher pleasures* and the notorious retort to a critic with comparison of "lower pleasures" to those of a "swine" (This is not without excessive criticism of his mentor and founder of utilitarianism) may lead the reader to wonder as to whether there was a correlation drawn between poor education and lower human capacity (schooling was far from universal; a very costly activity). (NB: Some contemporary reflections on utilitarianism covered below will be shedding some light on controversial matters and challenges to the concept.) While Bentham's *hedonic calculus* may find little application today, ordinal preference approach to decisions in management and healthcare alike do remain influential. Similarly, Mill's concepts of rule utilitarianism, the harm principle, and limiting the powers – not only of state but also of public opinion – were the principles of liberty that appear to influence contemporary values. Below is a more detailed elaboration of the impact of utilitarianism on contemporary management, health, and other fields of human endeavor.

Continued Impact, Legacy, and Novel Solutions for Corporate Goals: Controversies and Critique

Bentham's Panopticon is frequently addressed by critics and equality- and rights-oriented scholars.

It had become synonymous with surveillance, monitoring, and curbs on human liberties in society. Researchers analyzing his work tend to explore him as inconsistent, starting with Mill. There are interesting contrasts between his liberal and illiberal views. He is in favor of individual interest as the case is with private prisons while at the same time managers of such institutions would be subject to penalties, fines, and even prosecution should they fail to disclose the details of their functioning to a governance body answerable to the public. The accuracy of any of Bentham's proposed calculations of the best sum of pleasure and pain may not be practicable – as pointed out by Mill through the metaphor of astronomy which sailors do not need to use to navigate and rather resort to the *National Almanac* (Ryan et al. 1987: 296–7). However, his interest in codifying the notion of transparency both literal and metaphorical; then *the tribunal of the world*, designed to oversee the Panopticon; and the tribunal of public opinion – all of these concepts come to the foreground in the early twenty-first century above and beyond the contentious notion of surveillance which Foucault and Sheridan (1977) had addressed in his works. As Itai (2019: 3–4) suggests, there is a managerial notion of *the union of interests and duties* in Bentham's Panopticon, surpassing Foucault's views in *Discipline and Punish* (and other related or derivative work).

The surveillance in Bentham's concept surpasses the physical notion of control – Panopticon inspector being the metaphorical *spider in his web*, placing individuals under both physical and psychological control. Foucault's analysis cannot thus be entirely dismissed though the generalization he proposed may not be fully plausible: Foucault suggested that Bentham's view also reveals a capitalist pragmatism of penal practice, i.e., the profit-making utilization of the inmates or others under the controlling mechanism of Panopticon (schools, hospitals, etc.). Panopticon – Bentham's failed investment project in material terms – financially embarrassing, as observed by Russell (2009) does leave a legacy both abstract and concrete, as he had envisaged actual governing bodies that would scrutinize each other by means of

continued evaluation; these do seem to work in the public interest, within indeed a specified remit.

One of the major differences between this and what Mill had practiced in that respect was the one championing *individuality and independence of mind*, understanding the power of public opinion and social pressures to the extent that these forces may need to be kept in check. His notion of moral progress remains linked to the middle-level rules whereby one tests the existing ordinary moral principles as to their utility and does not always need to pursue the ultimate end of all action. The oversimplification of interests of all sentient creatures by the binary opposites of pleasure and pain remains the problem of principle. This is critiqued by current practitioners and theorists. Therefore: one aspect, concerning the sweeping nature of such a logical proposition and statement. And, two, the commentary that points at such binary opposites missing out on the nuances of *happiness*, which in some *neo-utilitarian* views is not an ordinal discrete category but a continual one. This is in the context of the calls to reform contemporary corporate goals (Jones and Felps 2013).

Novel Solutions Proposed: Some Examples

Jones and Felps (2013) explore the problems and offer solutions regarding the managerial running of contemporary corporations, at the very core of their professed goals and widely accepted objectives. Rooted in utilitarian logic and further redefined, set out by neoliberal values, shareholder wealth maximization (SWM) stands in contrast with a critical approach of normative stakeholder theory. Admitting to the fact that these proposed solutions may take very long time to be arrived at, Jones and Felps propose stakeholder happiness enhancement as a novel approach to the matter. Observing Hayek's criticism of utilitarian principles in that welfare enhancement is not an attainable goal, as it is not knowable (the "ideal observer" problem) what is the correlations of (corporate) actions and "the welfare of everyone else in the world," Jones and Felps (2013: 356–7) utilize cognitive psychology to scrutinize such logic. Observing that high levels of cortisone and high blood pressure are inversely proportionate to a notion of happiness, they adopt a neo-utilitarian approach to happiness

and pleasure, thus rebutting the claim of subjective limitations of experience in happiness and fulfillment. Thus opening the possibility of generalization, they further curtail the importance of interest as a means to happiness and therefore utility; the result is that a sequential logic of SWT is not without alternative, therefore problematizing the claim that firms *must* increase firm profits (2013: 358). Utility thus is stated as the means of seeking, not increasing profits at all cost. The significance of the physiological and cognitive components of such an approach – unknown at the time of early utilitarian theory – is that intersubjective propositions do have ground in science and objectively observable parameters that affect both shareholders and other varieties of stakeholder in business. The above is but one example of innovative approaches to a modified understanding of utility fit for the enhanced debates in highly developed corporate capitalist economy. It is essential indeed to add the notion of utility as described by Carroll (2016) in the context of corporate social responsibility, as the means of enhancement of positive goals may lay in further social engagement and impact.

Beyond the Panopticisms: Some Radical Approaches at the Turn of Millennia

Utilitarianism may be perceived as brutal by some; debates on the deontological and utilitarian nature of medicine are covered by a number of authors (e.g., Garbut and Davies 2012; Roscamp and D'Cruz 2017; Mazer 2017; Middleton 2007). Moreover, the logic of preference utilitarian opinion may be seen merciless as taking root in the “eugenic” argument presented by the influential contemporary utilitarian philosopher Peter Singer (e.g., Baroff 2000). A virtues-based question (not deontological in its entirety) – While the majority, middle-ground of *axiomata media* are continuously content, does utilitarianism attain its goals? Indeed, Baroff’s strong critique was faced with further refutations from those looking at cases of extreme disability. Those authors (e.g., Weikle 2000) had called for a balanced approach to specific cases; it may be extrapolated that this can be seen as a call for “postmodern” felicitous calculus. Nonetheless, a number of voices

expressed deep disquiet with implications of views that stand in stark contrast with deontological notion of rights.

In prose fiction, the boundaries of utilitarian thought were explored in Aldous Huxley’s critical Sci-Fi satire *Brave New World* (Diken 2011). The subject matter and critique were covered enthusiastically and in detail by BLTC, an organization practicing “negative utilitarianism” (e.g., Huxley.net 1998/2020; Conley 2017). Negative utilitarianism, the philosopher of science, Karl Popper, was one of its most famous proponents – professes as its key aim to minimize or end aggregate pain and suffering of humans and other sentient beings, whereas more traditional forms of utilitarianism aim to enhance the aggregate happiness of humans. BLTC (Better Living Through Chemistry) is closely connected to transhumanists, with one of its professed aims being the infinite extension of human experience, prolonging life, and editing the human body by any means required, including genetic surgery. It is therefore evidence that utility has no bounds but human imagination and goals of interest, hedonic notions of pleasure, or alleviation of pain. The subject of utilitarianism is complex and evocative of invention, self-enhancement, and worthy of intellectual consideration in the full variety of its guises. It is very likely to evolve into the future, branching out into novel ways of thinking, transforming, and mutating with technology, science, and forms of experience, redefining its form and purpose to suit.

Summary

Traceable to two very prominent authors of the eighteenth and nineteenth centuries, utilitarianism as a school of thought and model of practice is inherently connected to capitalism and continues to be so with its more advanced forms. Indeed, it can be argued that in the predominant school of thought impacting the world in the post-Second World War period, especially since the early 1980s, neoliberalism is one of its ultimate exponents. This is regardless of the fact that the most prominent thinkers of neoliberalism did not shy away from the critique of utilitarianism as a

relatively obsolete model. Similarly, as the new ethics espoused by postmodernist writers took hold and reshaped philosophy and social practice of the late twentieth century, we now see a novel transformation of utilitarian thought in new guises, with the same logic accelerated to new levels, in the form of transhumanism, which in turn borrows from Huxleyan dystopia and is decidedly non-deontological though equally disinterested in the original notions of utility as defined centuries ago. The very fact that utilitarian ideas survive such enormous transformations as presented by the two among many contemporary examples proves that their legacy remains enduring across the economy, business, and the sciences.

Value drivers; Value management; Value proposition

Definition

Value, and more specifically customer value, is the overall benefit derived, as the customer perceives it, at the price the customer is willing to pay. More precisely, value is the overall benefit derived from a product or service at the price the customer is willing to pay. Information about perceived customer value allows companies to adapt their offering to meet customer value expectations. And companies must understand how their customers perceive value. Perceived value is defined in terms of an existing trade-off between perceived benefits to be received and the perceived price for acquiring the product or service that delivers those benefits. Companies should understand what these trade-offs are and how to influence product and service configurations that can maximize customer value and business outcomes. The power of choice mandates that those

configurations that deliver superior value will win in the market place. The value proposition refers to the creation of value. Value delivering is the process that enables the delivery of the created value. Value capturing is how the firm exchanges the created value and generates revenue and profit from it.

Introduction

Generally, customer value is constituted by four segments: perceived quality, customer wishes (consciously and unconsciously), as well as perceived extrinsic (e.g., price) and intrinsic attributes (e.g., haptic). Additionally, the dimension of time plays also a role in customers' value perception (Zeithaml 1988).

In every profound value analysis, it is important to understand customers' "pains" that they endure in private or business-related contexts. Any solution, benefit, feature, or product/service element that will help in easing this "pain" will be thus regarded as something of value. From a marketing perspective, the goal of pricing strategy is to assign a price that is the monetary equivalent of the value the customer perceives in the product while meeting profit and return on investment goals. The price a customer is willing to pay, and therefore the price a company can achieve is always a reflection of the perceived value of the product or service in the customer's eyes. Understanding and quantifying value to customer is the

foundation of effective product and service development. Conversely, pricing approaches based on the customers' assessment of value are strategic and long term in nature since they are focused on monetizing the service value perceptions from each customer through the pricing mechanism.

The background of value analysis in a business context is closely linked to the development in the nature of competition between companies. Companies during the 1950s and 1960s have based their competition mainly on tangible product qualities. However, since tangible characteristics can be imitated, competition based on product qualities has reached a plateau from the 1970s. The new focus of differentiation was based on the additional services a company provides. To illustrate this evolution, one can think of the car industry with its various services such as financing, warranties, and insurance. Furthermore, also services became quickly generic, and the development of long-term relationships was considered as the new source for competition. The question of what happens if also relationships become generic was the starting point for a reconsideration of the traditional consumer behavior theory (Palmer 2010, p. 197).

A new experiential approach reconsiders previously neglected value variables and takes into account the roles of emotions in behavior, the significance of symbolism in consumption, and the consumer's need for pleasure and fun (Addis and Holbrook 2001, p. 50; Gentile et al. 2007, p. 396).

History of the Concept of Value and Price Determination

Scholars have been investigating economic value-related matters since ancient times. According to Monti (2011), these early debates were strongly influenced by basic ethical-political and ethical-religious motives. If prices and the corresponding value were perceived as too low or too high, this caused offence, and the consequences were strict and harsh regulations, sometimes even prohibitions. Consequently, a particular ethical attitude towards the use of pricing instruments emerged,

which could not yet pave the way for a well-thought-out pricing policy geared to increasing sales. A sales and customer orientation contradicted the nature of the management at that time, as it included unforeseeable risks. Elements such as ethics, morals, and proportionality as characteristics and guidelines of business management created dislikes against an overly individualistic or selfish management of the business. The reference to an "honorable" price was constant. Even in cases of monopoly positions, one's own profit should be "Christian" and not set excessively high (Monti 2011).

The intellectual age of scholasticism stretched from about 800 to 1500. The ultimate goal of the scholastics was the formation of an independent body of scientific thought that could be applied to all aspects of life (Chafuen 2003, p. 13). Scholasticism was not an economic science, as it rather dealt with ethical aspects of economic and investigated the relations and dynamics of humans towards goods and worldly. Scholastic ethics interpreted the divine world order and gave rules of conduct for daily life that were in harmony with Christian morals and the world view (Monti 2011, p. 35). The scholastics asked about the compatibility of real facts with the teachings of the Bible, the Church Fathers, and ancient (Aristotelian) philosophy. Thus, over the centuries, they came closer to an understanding and moral appreciation of trade with Christian prudence and morality. The trading activity was inseparably linked to the issue of fair value and pricing. The "fair price" was therefore the price that corresponded in its principles to a just exchange. This was given if in the business relationship, an exchange equality prevailed and hence equal countervalues were exchanged. The benchmark for operationalizing the value was the paid price that was valid on the market. Since ancient times, the moral-theological and social-philosophical question of pricing justice has prompted scholars to make comprehensive considerations about the factors that determine the price and the principles of pricing (Monti 2011, p. 40).

The solutions that the scholastics gave to the questions facing value and price cannot, of course, be applied to today's problems. Monti (2011)

states that the focus on value analysis for the scholastics was not trade and exchange per se but rather the field of price ranges and margins, which practically made up the profit of a merchant, in other words, the difference between purchase price and sales price, the so-called *lucrum*. The path between the allowed and possible behavior and the prohibited and thus sinful practice remained very blurred during this time. With his actions, the merchant was subject to the postulate of the fair price and value (Monti 2011, p. 40).

The mental and spiritual universe still exerted a strong influence on the daily work of a business owner, so that the idea of a fair price and fair value continued to dominate economic life at least into the seventeenth century. Pricing could not be based on microeconomic considerations but in many cases was dictated by the professional order. Price calculation was not the instrument of the merchant and his striving for success in trade and commerce, but it served to maintain a corporate economic life based on risk. The aim of maintaining the honor of the guild and its members was to produce impeccable goods (Monti 2011, p. 42).

Cost accounting in the Middle Ages essentially included labor costs and material costs. In the constitution of the economic value as the basis of the fair price, the estimates on the personal and material expenditure played a decisive role. Skill, the use of personal strengths and abilities (*labor*), and material expenses (*expensae*) had the greatest impact as factors of price and value determination (Monti 2011, p. 46). With the advent of the eighteenth century, the economic views of the scholastics lost their validity as the standards for value determination. This period of the Enlightenment established a methodological foundation which still forms the basic framework of economic science today and has pushed for the dismantling of ethically based economic doctrines: Individual laws and rules shaped the handling of the discipline, which put the focus on people who were concerned about their own advantage. In the Age of Enlightenment, the rules of the “old economy,” the compilation of topics of ethics, sociology, pedagogy, and agriculture centered around the unity of the household, had decisively lost

their influence on people’s thinking (Monti 2011, p. 46).

Starting in the Renaissance and especially in the mercantile system, business operations and profit prospects intensified. The (re)discovery of the business as a single economic unit and a rationalization of the methods for profit seeking commenced, with a consequent expansion of the sales volumes and the size of the businesses. The principle of economic efficiency, already present in the first stages since the late Middle Ages, gradually made its way through the economy of the mercantilist era (Monti 2011). This principle was closely accompanied by the need for profitability, which in turn acted as a catalyst for a fundamental change in internal business processes through a division of labor and by replacing relatively expensive cost factors with relatively cheap ones. The concrete economic expression of this change was represented by the market, which for the first time formed a real focus of economic activity and value creation. The market offered merchants the opportunity to almost fully exploit this phenomenon in their business endeavors and to use all the levers inherent in the market for successful commercial activity (Monti 2011, p. 46).

Nature and Categories of Value Drivers

Customer value drivers are the decision-related attributes that are perceived by the customer to be the most important to the choice process. Therefore, value drivers are based on customers’ beliefs about the product and the company that provides it, in addition to the intrinsic buying motivation and the buying situation (Mowen 1987).

The value for the customer originates from tangibles and intangibles that provide benefits for the customer, i.e., satisfy his needs. Sheth et al. (1991) were able to identify the following value drivers: functional value, social value, emotional value, epistemic value, and conditional value driver. Functional value is the perceived utility that derives from a product’s physical, utilitarian, or functional attributes. Social value is

derived from an association with an identified demographic, socioeconomic, cultural, or ethnic group. Emotional value derives from the ability to arouse an emotional or affective state. Epistemic value is acquired as the result of its ability to arouse curiosity, provide novelty, and/or satisfy a desire for knowledge. Finally, conditional value derives from the specific situation or context of the purchase or usage decision. A more modern approach seeks to merge these categories of value drivers into a total of three important spheres of value creation.

The value drivers can be classified into economic (Nagle and Holden 1995), emotional (Sheth et al. 1991), and community value drivers (Chiang 2020). Economic value drivers deliver usually tangible and measurable benefits to consumers and companies, such as the ability to improve revenue and reduce cost, a better impact on balance sheets, the reduction of risk management, and hedging costs. Economic value drivers are furthermore based on perceptions about the cost of acquiring, owning, installing, using, and disposing of a product or service. Economic value drivers can be quantified in monetary value.

The second category are emotional value drivers that mainly appeal to consumers rather than companies. In fact, these benefits will help individuals achieve self-actualization or self-esteem and will bond the individual with a community of like-minded peers. Emotional value drivers will drive customers towards feelings of social acceptance and prestige. Emotional value drivers also cover basic emotional functions, like physiological needs. By definition, emotional value drivers are intangible (Sheth et al. 1991).

The last category has received greater attention in the last years, especially with the rise of the importance of a sustainable and socially responsible business behavior within larger communities. Being able to deliver security and safety is a key community value driver, as many consumers want to be protected from physical or mental harm. Other community value drivers are the ability to execute social impact and engaging society, the facilitation of rights and freedom of choice and expression, and finally the possibility to protect

the environment and have a positive impact on sustainable development goals (Chiang 2020).

Two of the most powerful value drivers are intangible benefits, namely, convenience and peace of mind. Even if a product or service is not fully utilized, consumers show a willingness to pay for these specific intangible benefits.

Examples:

- Free cancellation policy (“... what if something happens?”)
- Flat rates/unlimited consumption (“... I don’t usually eat much, but...”)
- Priority access (“... it is good that I can buy this earlier than others...”)
- Loyalty/membership cards (“... I can always have savings if I want to...”)

The price or willingness to pay of the customer and the price achievable by the provider are always a reflection of the value of a product perceived by the customer.

Value Delivery Process

When delivering value to customers, both in consumer- and in business-oriented settings, three important steps have to be taken.

The first step constitutes value creation. The ability to deliver innovative solutions, together with unique material conditions and overall product quality and design, is a fundamental element in order to be able to generate and create meaningful value to customers. The selection of customer segments also creates value, because customers have different requirements and perceptions.

The second step is value communication. It is paramount to be able to send out the right and appropriate messages on products and services that convey to the targeted customers the value created before. The specific positioning of the product or service is also an important tool to communicate value. In this respect, premium brands and low-cost brands serve the function to transmit the underlying value. Furthermore,

elements of packaging products, the presentation, and even the placement of a product in a store can help contribute to the value communication in a significant way.

The third step in the value creation process is the step of maintaining value. In the case of durable consumer goods is the willingness to pay influenced by the preservation of value at the time of the initial purchase. For luxury articles or other goods like automobiles, the preservation of value over a longer period of time makes a decisive contribution to the initial willingness to pay.

Once a company has gained clarity about the value, it should approach the concrete price setting. Moreover, when determining the value, for which in practice there is a wide range from highest to lowest quality, the company must keep the achievable price in mind from the very beginning. The decision to use a product or service, and the subsequent steps to buy, and the price that customers are willing to pay – all these decisions are dependent on the possibility to assess the value that customers will receive from the product in question, relative to other possible alternatives. The emergence of the digital information economy has contributed to the convergence of knowledge, goods, and services into total product solutions that attempt to maximize customer perceived value and, hence, customer satisfaction. Thus, digital value propositions may include the ability to access and use (rather than own) products and services, as well as the increased capacity to reduce effort and to save time for customers. Digital value propositions may also be based on elements of superior customer experience and customer usage.

Summary

The concept of value, and more specifically customer value, can be defined as the overall benefit derived at the price the customer is willing to pay. In this context it is not only important for companies to understand how customers perceive value but also to assess the various value drivers that are important to customers. It is therefore paramount to understand customers' "pains" that they

endure, and any solution, benefit, feature, or product/service element that will help in easing this "pain" will be regarded as something of value. Understanding and quantifying value to customer is the foundation of effective product and service development. Historically, the concept of value has been strongly influenced by basic ethical-political and ethical-religious motives. The reference to "honorable," "fair," or "just" prices can be constantly seen throughout the Middle Ages and up to the modern era. While the costs of production and materials were at the core of value perception, the nature and categories of value drivers have changed in a modern business setting: from functional to social, emotional, epistemic, and conditional value drivers. Furthermore, modern value delivery includes the steps of value creation, value communication, and maintaining value.

Value chains can become complex and dynamic systems, with different dimensions (company, sector, industry, country, global), and diverse forms, that interact with each other. That is why, in the same way, there is no single methodology or a better methodology

Introduction

Value chains are an essential element for sustainable development, not only in economic terms but also in the environmental, social, and cultural dimensions. In recent years, factors such as globalization, advances in logistics and communication technologies, and changes in consumer preferences and consumption habits have increased the complexity of value chains. Firms' competitiveness increasingly depends on what happens along the value chains, and the different stakeholders are increasingly aware of the importance of understanding their functioning. That is why the scientific community has increased studies with a value chain approach, which in many cases try to find out value creation along the value chain, from producer to consumers. Despite this interest, the analysis of value chains encounters various barriers, among which the difficulty in obtaining the necessary information stands out. This data gap in many cases limits the methodologies that can be applied to understand the functioning and relations at value chains and, therefore, the usefulness of the results.

Although the value chain is defined by multiple authors, and there is a basic theoretical conceptualization of it, in reality, value chains can become complex and dynamic systems, with different dimensions (company, sector, industry, country, global), and diverse forms, that interact with each other. That is why, in the same way, there is no single methodology or a better methodology for the generality of the cases. There are multiple

VCA methods, designed and applied mainly according to the approach from which it is studied (firm, industry, country, or global) and the information and time available. However, and despite a certain degree of standardization in these methodologies, the final design is always adapted to each case, depending on the combination of certain factors such as scope, information, time, resources, and knowledge.

The objective of this work is not to review all the possible methodologies of VCA but instead, and in a simple way, present the main approaches applied to the analysis of the value chains and the main factors conditioning the design and development of the VCA. First, we briefly clarify the concept of value chain and its most recent evolutions. Second, we identify the main VCA approaches. Next, we discuss about the most value chain dimensions, a key aspect for VCA design, implementation, and interpretation. Then, we present some of the most relevant and recent applications of VCA. Finally, we close the work with some conclusions and future directions about VCA.

The Concept of Value Chain

Michael Porter introduced the concept of value chain as all those activities that a company develops to offer a product or service with value added in the market (Porter 1985). The final value added in a product or service is the result of the aggregation of the value added in each of different activities during the production process. A firm has to analyze its level of efficiency doing each of the activities within the production process. This allows to identify sources of competitive advantages (Brown 1997), but also it helps to find those activities that should be outsourced or relocated to a more efficient actor. Efficiency of each of the task in the production process determines cost and margins, so indeed, it influences firm's competitiveness and profitability. Porter's model identifies different generic activities within a value chain, both primary and secondary activities. Primary activities are inbound logistics, operations, outbound logistics, marketing and sales, and

services. Secondary activities are classified into procurement, human resource management, infrastructure, and technological development (Porter 1985). This model has been, and still is, a key strategic management tool to understand the value creation in organizations and improve their competitiveness.

Porter's definition of value chain has a clear internal orientation in the organization, related to strategic management. This way of understanding the value chain is closer to a simple value chain, which defines all those tasks and production steps needed to obtain a good or service and is often identified with the activity of a single company. Nevertheless, the extended value chains consider also more activities and agents involved in the development of the product or service, what helps to describe a more complex reality. Moreover, the configuration of a value chain can be interconnected and interrelated with other value chains (Kaplinsky and Morris 2000).

Extended value chains began to take on more relevance in the 1990s, with the takeoff of the processes that led to globalization. The manufacture of goods and the provision of services started to involve many companies, in different countries, or even the same company, in different countries. Thus, global value chains (GVCs) emerged as the international extension of the Porter's value chain (Jones et al. 2019), simply due to the fact that the activities that occur in these chains have been developed in different countries. In a GVC, production takes place along a value-adding chain of activities developed not only within a factory or a single firm but also in chains that link multiple firms, facilities, infrastructures, and companies located in different countries (Sturgeon and Memedović 2011). In GVCs the value created by cross-national task transfers is a relevant factor with implications for firms, industries, and countries (Inomata 2017).

With globalization and the appearance of GVC, VCA began to be relevant and useful, not only for firm's strategic management but also for the competitiveness and sustainability of industries, the evolution of international trade, and countries' economic development. More recently, value chains are undergoing significant structural

changes, due to the rise of green economy policies and the development of a new industrial revolution which is not just based on technology but is also information and digital driven.

Value Chain Analysis Approaches

Traditionally, VCA is applied as a strategic instrument to analyze firm's activity and improve organizations' efficiency and competitiveness. Under this internal approach, VCA aims to identify which resources and activities provide a competitive advantage to the organization. Based on Porter's conception of the value chain, VCA is a useful approach in developing firm's strategic planning, that is, the organization process that makes decisions affecting its competitiveness and profitability (Ensign 2001). VCA helps managers and practitioners to understand the sources of competitive advantages, identify interrelations between activities that create value, and formulate competitive strategies (Ensign 2001). Since Porter defined the concept of value chain, VCA has been broadly used in business administration and strategic management to define, implement, and evaluate firms' strategies. Nowadays VCA is still a widely used tool in firms' internal management, although it has evolved in parallel with the evolution experimented by the concept and structure of value chains.

With the internationalization of business and economic activities, and the appearance of GVC, value chain analysis has been applied to different approaches beyond the boundaries of the firm (Zamora 2016). According to Frederick (2014), VCA analyzes interfirm relationships in order to understand firms' current situations and their potential evolution. Frederick even goes deeper into the external dimension of the company, stating that "the objective of value chain analysis is to determine how and where power is exerted along the chain and by whom (firms or institutions)." Under this conceptualization, VCA has been applied to analyze industries as a whole, as well as industry clusters. This more recent and extended approach of VCA considers the value chain as complex network within which value

creation is the consequence of the interactions not only between producing companies but also between the rest of agents necessary to make the good or service reach the final recipient (Zott et al. 2011). Some of the actors are directly involved in the different stages of product design, production, and placement and others as auxiliary actors in the process, providing technology, services, infrastructures, research, financing, and insurance, among others. However, the latter are, in most cases, direct and indirect actors in other value chains. As a result, this simplistic classification generates confusion when analyzing the structure of a complex value chain, from an industrial or global perspective.

In recent years, several authors have tried to clarify and put order in who is who in this new approach to the study of value chains, and among them, the value chain reference model (VCRM) proposed by Frederick (2010, 2014) stands out for its clarity and usefulness. Figure 1 shows the four parts or dimensions that the VCRM model identifies within a value chain, and below we provide a briefly explanation of each one.

Value-adding activities: this dimension defines the six main steps normally needed to develop a product from its conception to the final recipient. Frederick breaks down the production process into these activities: research and development, design, logistics, production, marketing, and services. These activities are business functions a firm may engage, from one to all six of them, and which stakeholders can engage in. Some of these functions may not require physically transforming the product, but they provide value added to the product (Frederick 2014).

Supply chain: analyzes production and logistics activities beyond the conception of a simple value chain. It covers the input-output process with four elemental stages: inputs, components, final products, and distribution and sales. Supply chain focuses in the physical distribution of the inputs, components, and products across the different stages of the chain (Frederick 2014).

End-use markets: this dimension defines three different distribution channels and buyers according to the purpose for purchasing the product: consumer retail markets (personal use),

Value Chain Analysis, Fig. 1 Value chain reference model (VCRM). (Source: Frederick (2010, 2014))

industrial markets (industrial use), and institutional/public use markets (products used by public institutions) (Frederick 2014).

Supporting business environments: includes the local and global entities that support and influence related stakeholders. Participants in this environment can be separated into six general categories as can be seen in Fig. 1. These organizations create rules and provide resources into the value chain and are responsible for establishing and enforcing institutions in different forms that may improve or limit the performance of the value chain. The influence of these institutions can be local, regional, national, or global, and these actors can represent public or private interests (Frederick 2014).

One of the main advantages of this model is that it allows to differentiate and associate the activities that involve a physical transformation of the product through the supply chain, from those value-adding activities (Frederick 2014).

Value Chain Dimensions

The design and implementation of VCA need an approach that considers the different value chain dimensions. Below, we present some of the main classifications of these dimensions.

Fearne et al. (2012) identify three critical dimensions to adopt a holistic VCA approach that incorporates sustainability in the achievement of a competitive advantage, thanks to the consideration of social and environmental aspects.

Boundary of analysis. Traditionally, VCA has been applied to evaluate firms' internal dimension, in line with the Porter's original value chain conceptualization (Fearne et al. 2012; Zamora 2016). Nevertheless, nowadays, value chain length has increased, and production processes have become international, with multiple firms involved in several countries. Value chain studies no longer only analyze interactions between tasks in the same company, but the relationships between tasks involve interactions between organizations, often located in different countries, with different cultures and regulations. This new context implies that the study of value chains may require a boundary of analyses beyond the intra-firm, since the competitiveness of a company or an industry is determined by the relationship and behavior of different agents throughout a value chain.

Scope of value considered. Within the same value chain, consumers can value different product

attributes and characteristics. Within the same market, there can be heterogeneity between consumers, and the final value of the product may vary according to factors such as customers' income, gender, education, or culture. These aspects influence willingness to pay, and therefore, VCAs should in these cases consider the different market segments instead of treating the consumer as a single and homogeneous group (Zamora 2016).

Governance. Gereffi (1994) defined governance as "authority and power relationships that determine how financial, material, and human resources are allocated and flow within a chain." In the value chain context, this implies that the performance and sustainability, both of a firm as an individual actor in the chain and the industry as a whole, can come to depend to a great extent on the relationships that exist between the agents of the same, on the distribution of bargaining power among them, on the role played by third parties such as administrations or business associations, and, to a certain extent, on the degree of coordination and collaboration between all of them.

Another proposal to describe VCA dimensions is that of Frederick (2014), in which this author divides the value chain framework into four blocks that helps to understand the structure, functioning, and interactions among agents in the chain and, therefore, can be used to implement a VCA approach and analysis. These four blocks are:

Input-output structure: includes the supply chain segments and value-adding activities included in the VCRM model.

Geographic scope: the industry activities included in the input-output structure can take place in locations in more than one country, and countries participate in industries by leveraging their competitive advantages in assets.

Governance: it refers to the ability of a firm or organization to exert control and power along the value chain.

Institutional context: how local, national, and international environment and policies configure the different stages of the value chain.

Later, Gereffi and Fernandez-Stark (2016) added two more dimensions, upgrading and stakeholders analysis, to the four defined by Frederick (2014):

Upgrading: economic upgrading is the process in which firms, countries, or regions advance to higher-value activities in the value chain in order to increase the benefits (e.g., security, profits, value-added, capabilities), specially from participating in global value chain (Gereffi and Fernandez-Stark 2016).

Stakeholders analysis: industry actors are not only mapped, but also their main role in the chain has to be explained. Examples of the most common stakeholders in the value chain are companies, industry associations, employees, educational and research institutions, government agencies, and ministries. How relations between these actors are governed and which institutions may drive change are key information not only to understand the value chain but also to propose policies and recommendations (Gereffi and Fernandez-Stark 2016).

Value Chain Analysis in Practice

The methodologies for developing a VCA are very diverse, and there is no generic methodology, nor strict rules on how it should be developed. In reality, in what there is some agreement is in that a VCA in practice should use or combine different methods or types of VCA, which provide different types of information about the value chain under analysis, have different advantages and limitations, and finally complement each other to help gain a better understanding of what it is like and what happens in the value chain.

VCA comprises qualitative and quantitative methodologies. Hellin and Meijer (2006) recommend using qualitative methodologies first and then apply quantitative methods. This qualitative

approach mainly aims to map the value chain, while the quantitative methods are used to understand the relations between the different actors and stakeholders involved in the value chain.

Frederick (2014) proposed an approach to developing a VCA based on its four value chain dimensions. The four blocks or dimensions that this author identifies in the global value chain framework are converted into two steps described below:

Value chain mapping: it contains the two first dimensions (input-output and geography), and it uses mainly qualitative methods. Value chain mapping aims to describe the structure of the chain through the identification of the geography and activities of stakeholders involved in production process, from raw materials to final customers. It includes methods used to identify and map the structural elements and actors in the value chain, including qualitative (market reports, firm reports) and quantitative (labor, trade, market, firm statistics, and data), secondary (companies, industry, regional, national, international, public and private organizations, and associations), and primary data (interviews, questionnaires) sources (Frederick 2014).

Value chain analysis: it seeks to determine the role that dynamic factors (governance, institutions, and interfirm relationships) play in conditioning the location, development, and competitiveness of a product or service. Value chain analysis considers governance and the institutional context in order to determine how and where power are exerted along the chain and by whom and how firms and institutions influence innovation, marketing, and risk (Frederick 2014).

Another essential aspect when implementing a VCA is access to information and the necessary resources (human, financial, and time horizon) to obtain it. The availability of information determines in most cases the methods that can be used to make a VCA. The more ambitious a VCA is in terms of boundary and scope analysis, the more difficult and costlier it is to obtain the

information and the most likely the appearance of limitations in the data that do not allow the application of quantitative methodologies based on econometric models. This is the case, for example, of price transmission or market competition, which demands long enough price time series.

VCA Main Applications

The VCA has traditionally been applied as a tool to determine the competitiveness and strategy of companies. With the increasing complexity of value chains, globalization, and interest in sustainable economic and business activity, the use of VCA has spread to other areas and objectives, from a firm internal dimension to industry, country, and global approaches with different goals.

Frederick (2014) describes several principal applications of the VCA that include different actors and stakeholders as recipients of the results of the analysis. Governments, NGOS, industry associations, researches, and other stakeholders use VCA as a benchmarking tool that maps the value chain to identify the structure of the chain, its actors, and length. Then, the understanding of the value chain functioning helps to provide policy and upgrading recommendations. Finally, VCA facilitates the creation of visual and analytical tools that help to disseminate information about the value chain and improve transparency.

Gereffi and Fernandez-Stark (2016) highlight that in the context of global value chains, in addition to helping governments in the design of policies, nowadays the VCA is also applied to support emergent industries such as offshore services; help to include SMEs in GVC, particularly in agrifood industries; and promote the economic and social upgrading, especially in developing countries.

Future Directions

Nowadays, VCA is becoming a key driver not only for firm strategic management but also for governance and policy making. Schmitz (2005) highlights three key structural changes to explain

the relevance of the study of value chains for policy makers: first, the internationalization of production processes and the globalization of manufacture and service chains across multiple countries; second, the fact that some activities add more value and are more profitable than others within a value chain, so that policy makers aim to guide local firms to move into these more value-added activities. Third, there is heterogeneity in the power that the different agents exercise over the chain, and there is an increasing concern about the sustainability of those chains in which powerful actors set the government rules.

New VCA approaches need to overcome the limitations of traditional analysis, that in many occasions present static results, that do not allow to reflect the dynamism of the reality of the companies (Kaplinsky and Morris 2000). One of the main conclusions in this work is that there is no ideal methodology for the analysis of value creation and competition relationships in value chains. The availability of information and resources to obtain said information determines the type of analysis that can be carried out.

Most analyses use prices as the source of data because they are easier and less costly to obtain than costs. The simplest and most intuitive analysis is the study of the evolution of the price series. But this type of analysis, while useful, does not provide scientific evidence. More sophisticated methodologies such as price integration provide information on competitive relationships in the value chain. However, these methodologies that provide information based on prices require complete price series over time, at different levels of the value chain, which requires standardized information data collection systems.

Those works that determine not only price structures but also cost structures along the food value chain, and hence margins, are far fewer in number. Furthermore, in most cases, these works are developed by national or supranational public institutions or large research projects. One of the main characteristics of these works is that they are static, they are a photograph in time, and there is no continuity, due to the difficulty and the enormous effort and consumption of resources that their realization requires. This means that the

available studies improve the knowledge about certain chains, but they are not a tool to support decision-making and monitoring the impact of measures and policies.

In general, VCA works adapt the methodology to the information available for the case or the value chain they address. However, a project or research that addresses multiple products in multiple countries requires a flexible design that allows the largest amount of information to be provided depending on the resources and information available in each case.

In this context, more and more authors recommend encouraging and supporting the development of VCA systems that combines different methodologies to make efficient use of available resources, considering the advantages and disadvantages of each type of analysis. These systems would be constituted by a basic analysis methodology, based on the dynamic analysis of flows (quantities, prices, etc.), and other complementary methodologies, both qualitative ones, such as value chain mapping, and quantitative ones, for example, the analysis of the cost and price structures, price transmission, or marketing integration. The basic methodology would allow generating an analysis tool that provides continuous information over time on the largest number of chains and products. Complementary methodologies would make it possible to complete and improve knowledge about value chains, performing analysis of case studies on different chains. The selection of the chains and the methodologies would respond both to the interest in certain products and to an efficiency criterion conditioned by the availability of information. The use of artificial intelligence techniques, data-driven decision-making, and system dynamics methodologies will be key methodologies to provide dynamic information on value chains, in an increasingly digital economy.

Summary

VCA is a widely used tool in firms' internal management, although it has evolved in parallel with the evolution experimented by the concept and

structure of value chains. It has traditionally been applied as a tool to determine the competitiveness and strategy of companies and is becoming a key driver not only for firm strategic management but also for governance and policy making. New VCA approaches need to overcome the limitations of traditional analysis, which in many occasions present static results, that do not allow to reflect the dynamism of the reality of the companies.

Definition

Value chain management (VCM) refers to the decisions and action taken by a firm in order to optimize its value chain. The value chain is a

representation, introduced by Porter (1985), of the firm as a chain of linked activities that work together to create value for the customer. The linkages can arise from the need for optimization or from the need for coordination. “Managing” the value chain means properly managing these activities and linkages in order to create value and achieve competitive advantage. It is important to underline that VCM differs from supply chain management (SCM), although the supply chain is central to VCM.

VCM has evolved consistently in response to rapid and complex changes in the context in which firms operate and therefore in firms’ activity. Since an enterprise has relations with other firms, often spread across the world, its strategies drive the reconfiguration of the value chain, taking into account the value chains of other entities. The environment forces the firm to extend its value chain beyond its boundaries, in many cases to create a global chain. For this reason, VCM requires it to expand its analysis, enhance its partnerships, and build more pervasive information systems.

Another relevant change, which has deep impacts on the value chain, is the growing attention to social responsibility and to the effects of a firm’s action on the environment, society, and the community. Nowadays the concept of a

sustainable value chain is central in the debate, partly stimulated by the article by Porter and Kramer (2011) about creating shared value. Social issues have a relevant impact on the firm’s value proposition and on VCM.

The Value Chain

The value chain was introduced by Michael Porter in 1985 as a representation of the levers used by a firm to create competitive advantage. Competitive advantage can be obtained through two opposite strategies: cost leadership and differentiation leadership. In the first strategy, the firm pursues lower costs in relation to its competitors who produce the same product. In a differentiation strategy, a firm seeks to bring a unique product to the market that its competitors are not able to produce. In addition, a third strategy is possible, as an organization can focus on only one or a few segments of its market and pursue, in this specific area, a cost leadership or differentiation strategy. The strategies to obtain competitive advantage are summarized in Fig. 1.

Porter argues that every organization must create value for its customers and that, in doing so, it can achieve a competitive advantage and become successful in its market. Value is a complex

Value Chain Management,
Fig. 1 Strategies of a firm
(Porter 1985)

concept that can be summarized as the price that a customer is willing to pay for the product or service produced by the firm.

The value chain considers the organization as a group of activities and processes that are linked to each other and oriented to create value for the customer. In other words, an activity (or process) creates value if the customers detect the activity, appreciate it, and assign a value to it (in terms of the price they pay, e.g.). According to Porter, there are two groups of activities (Fig. 2): primary activities and supporting activities. Primary activities are those involved in the production of goods or services and in their delivery to customers, including post-sale services. Primary activities are:

- Inbound logistics
- Operations
- Outbound logistics
- Marketing and sales
- Services

Supporting activities are those that make available, to the entire firm, the resources (physical, human, capital, etc.) it needs. Supporting activities guarantee the flow and correct use of resources for the performance of the primary activities. Supporting activities are:

- Procurement
- Technology development

- Human resource management
- Infrastructure functions such as finance, accounting, control, legal, quality management, etc.

The “macro” activities listed above could be divided into sub-activities, which are groups of single operations that are homogeneous and are able to generate a measurable output that contributes to the value generation. More specifically, Porter (1985) underlines that, in both primary and supporting activities, activities coexist that contribute in different ways to value creation. Some activities, such as those of sales forces, the assembly line, etc., contribute directly to the creation of value for the customer. Other activities, such as planning, the management of sales forces, the management of R&D, etc., contribute indirectly by making it possible for the direct activities to be performed in a continuous manner. Lastly, there are activities like monitoring, testing, and possibly reworking that contribute to creating value for the customer by ensuring the quality of the other activities.

Moreover, even if the activities can be distinctly observed and described, they are strongly interdependent and are linked to each other in creating value. A linkage is the relationship between the way one activity is performed and the cost or performance of another activity (Presutti and Mawhinney 2013; D’heur 2015). Such linkages can arise from the need for optimization

Value Chain Management, Fig. 2 The value chain

or from the need for coordination and, if properly managed, they lead to the creation of value and the achievement of competitive advantage. For example, decisions regarding the activity of investing in quality assurance have a significant impact on post-sale (assistance) costs, reducing them and contributing to value creation.

As a firm works in an open environment, where it comes into contact with many other firms, the value chains of different firms are connected. Porter speaks, in this case, of vertical linkages. The most evident example is the relationship between a firm and its suppliers (the upstream direction) or that between a firm and its clients (the downstream direction). The value chain of the supplier has an impact on the value chain of the firm, as decisions about the former firm can contribute to the creation or destruction of value for the latter firm. In a similar way, the value chain of a client or a distributor can enhance or weaken the process of creating value and the competitive advantage of the firm.

As mentioned above, the linkages can arise from optimization or coordination but, in this case, they are more complex because they concern two entities that may have conflicting goals.

These considerations open the way to value chain management as well as to supply chain management (SCM) and, more recently, to value chain management from a sustainable perspective.

Value Chain Management

The value chain represents the activities of the firm, the linkages between them and the potential interdependence with the value chains of firms that have connections with the firm. "Managing" the value chain means detecting these linkages and exploiting them in order to pursue a competitive advantage through the strategies described in more detail above. A firm can also enhance and shape its relationships with its suppliers and clients, creating new linkages that support value generation for all the actors in the whole chain.

Often, in the literature, value chain management (VCM) seems to overlap with supply chain

management (SCM). The latter has become more and more central in enabling the firm to bring products and services to its customers in a reliable and efficient way (Presutti and Mawhinney 2013; D'heur 2015). SCM progressively expands from operational to organizational and strategic aspects. This evolution has an impact on the whole firm and on other entities belonging to the firm's network. It leads to an interchangeable use of the terms "value chain" and "supply chain," despite there being some differences between them.

In the literature, three perspectives are prevalent.

In the first, VCM and SCM flow in opposite directions. Value chain management starts by considering customers' needs and requests, and shapes the products and production processes in order to generate value for the customer (Feller et al. 2006). On the other hand, supply chain management aims to define a flow from the product to the customer in the most efficient manner. Authors writing from this perspective emphasize the complementarity of VCM and SCM and the need to integrate them.

In the second perspective, SCM is so wide and interwoven with a firm's strategy, operations, and organization that it almost assumes the same meaning as VCM. This approach, closer to a practitioner's point of view, brings integration between VCM and SCM to the extreme of a complete overlap (Presutti and Mawhinney 2013).

In the third perspective, SCM is a part (with a growing relevance) of VCM. In this sense, "the value chain is the combination of products and supply chains of a company" (D'heur 2015, p. 25). Authors with this view emphasize the importance of listening to and interpreting the customer's needs in relation to the product design and all activities not strictly related to the supply chain (Sweeney 2009; D'heur 2015). In this view, the value chain also involves relationship management and information management, suggesting the need for "coordination" as a priority in successful value chains (Walters and Lancaster 2000; Al-Mudimigh et al. 2004).

In general, "VCM is concerned with managing integrated information about product flow, all the way from suppliers to end-users. . . VCM is

concerned primarily, with the customer from start to finish” (Al-Mudimigh et al. 2004, pp. 311–312).

As already underlined, VCM is fundamental in building a firm’s competitive advantage. Presutti and Mawhinney (2013) indicate some dimensions that must be addressed in order to be competitive and consequently have good performance: cost, quality, response time, and flexibility. In pursuing these goals, an efficient and effective value chain plays a key role (see Fig. 3).

First of all, VCM forces an organization to make its value proposition clear, taking into account customers’ needs and the business environment. Porter (1985), for example, argues that the value chain is affected by the following aspects of the competitive environment: the segment, the intensity of integration, the geographical context, and the industrial sector. Each factor should be considered in building the value proposition and the consequent value chain. VCM helps a firm to define its position in the market, its values and beliefs, its core competencies, and its strategy for approaching the market and the customer. Moreover, it supports the firm in relating its mission and vision to the customer relationship.

Second, the design of the value chain aims to consider the value stream. The value stream comprises two flows: one (physical) from the raw materials to the finished product, and the other (information) that moves backward from the customer’s order to the production. The organization must synchronize the flows correctly. In this sense, a value chain analysis establishes the activities and the linkages between them, overcoming the silo approach, implementing a process

approach, and shaping the chain by considering the value drivers. The intent of the firm is to improve efficiency, on the one hand, and to reduce uncertainty (e.g., in the relation between demand and supply) on the other. This analysis is the core challenge in VCM, and can involve different tools, such as process analysis, lean thinking, leadership management, change management, target costing, etc. A firm must bear in mind that the design and development of the product are fundamental in meeting the customer’s need for a reliable and successful product or service. This activity requires close integration between the different departments of the firm, and a cultural attitude of cooperation and dialogue. Some authors (e.g., Presutti and Mawhinney 2013) speak of boundary-less organization, in the sense that there is organization-wide integration. The design of the value chain is a result of organizational, technical, and informational drivers that, using many different tools, aim to pursue the goals of cost, quality, response time, and flexibility described above.

In particular, flexibility provides evidence of a third relevant point: a value chain has to be continuously monitored and revised in response to environmental changes and new or different customer needs. In this monitoring, the firm has to be able to “listen” outside and within itself, through a strong relationship with its market and a high flexibility in the organization. This leads to a continuous improvement of the value chain, so that it becomes more effective and efficient. Various factors, again, could drive the firm to do this: dialogue and cohesion between people, a shared culture of “value chain management” as a driver of the firm’s performance, and an efficient and

Value Chain Management,

Fig. 3 Competitiveness, profitability, and the value chain (Presutti and Mawhinney 2013, p. 28)

integrated information system that supports the measuring and monitoring of the value creation and value chain performance.

Extended Value Chain Management

After the introduction of the value chain, the concept soon overcomes the boundaries of the firm and underlines the importance of integration with other firms in managing the value chains of the different firms as a unique chain. As markets are wider and more complex than in the past, the global value chain framework (Gereffi and Lee 2012) aims to describe how different firms in different countries relate to each other in a value chain.

The concept of SCM itself has evolved, thanks to the work of the Supply Chain Council in providing and updating the SCOR (Supply Chain Operations Reference). The SCOR is a model that describes different supply chain configurations and helps in building and monitoring the mode of operation and performance of the supply chain (D'heur 2015). Al-Mudimigh et al. (2004) point out that SCM has changed and expanded as a consequence of several facts: i) the globalization of production and distribution; ii) the shift, in many markets, from mass production to customized production; and iii) the huge development of integrated information systems.

Porter (1985) introduced the seminal idea of the extended value chain, pointing out that every firm has relationships with suppliers and clients who have their own value chains. As these relationships affect the firm, they offer the opportunity to enhance or, vice versa, to weaken the value chain of the firm. This means that an appropriate VCM has to manage the linkages between value chains along the whole extended value chain. Initially, SCM and, in particular, the areas of inbound and outbound logistics, were involved in managing the upstream and downstream flows. This phenomenon, however, has grown rapidly in a global world, and it has become clear that an extended value chain could include many firms that are related in a network and are often geographically distributed across the world.

By competing in a worldwide context, firms have realized that having an efficient and effective value chain is more difficult.

A study by Chartered Global Management Accountant (CGMA) (2014) highlights some relevant points. First, there are more sources of value-creating activities than in the past, because of the interrelations between the value chains of different firms and different countries. Second, the exploitation of these sources demands that the “contractual” view is replaced by a “partnership” view. Third, the extended value chain is affected by many challenges. CGMA identifies three main challenges:

- Globalization
- Demographic change
- Digitalization

As emphasized above, globalization offers many opportunities to expand the value chain and to make it more efficient, by finding the firms that perform certain activities in the best way. Moreover, globalization could facilitate flows of goods and services, enabling a more effective supply chain. However, some risks arise in managing a global value chain: geopolitical instability, differences in legislation, compliance requirements, and the potentially complex governance of such different contexts.

Demographic changes and development of new large urban areas around the world change the value chain strategy to a “next-shoring” approach instead of an off-shoring one. This means that, in the value chain, proximity to demand and to innovation will be success factors. This “proximity” leads to a closer link between the product and the local market situation, and to a more intense co-innovation in the value chain.

Digitalization is a relatively new phenomenon that will be pervasive in managing a firm. The large quantity and the better quality of information have relevant impacts on the value chain, as they make the flow of information between the partner and the organizations in the extended value chain more efficient. Moreover, digitalization provides the opportunity for a direct link to the final consumer, enhancing and transforming the post-sales

service and leading to a better customization of the product.

An extended or global value chain involves actors operating in different countries, with problems of languages, times, culture and approach to business. This implies that a global value chain probably needs more stable and long-term, but at the same time more flexible, relationships, and a high level of trust and cooperation. In order to seize these opportunities and to limit the risks in the extended value chain, some of the enabling factors described in the previous section are even more important.

For example, dialogue and cohesion between people is more complicated because of the physical and cultural distance between actors, but it constitutes a cornerstone in building a fluid and efficient value chain. In this vein, trust between actors is a crucial lever in enhancing relationships and communication in the value chain. Undoubtedly, technology plays a fundamental role in this process, by facilitating, sharing, and speeding up the flow of information. Al-Mudimigh et al. (2004, p. 318) describe the “partnership approach” as one of the pillars of value chain management, and point out how collaboration implies “free sharing of information and the mutual leveraging of various capabilities” and the constant adaptation of the network supply to generate value for the customer.

Value Chain Management and Sustainability

Companies face strong competition that has driven research into the new configuration of the internal and extended value chain. In recent times, a new issue has challenged firms and their value chains: sustainability.

On the one hand, the value chain considers the idea of creating value for the customer to be central.

On the other hand, as the UN Brundtland Report (1987, p. 15) argues, “. . . sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own

needs.” This shifts the focus from a narrow view of the firm (even if the view extends to its economic environment) to a long-term view and to a specific role for the firm in preserving resources and giving opportunities to future generations in creating value.

Recently, the European Union Commission (2011, p. 6) has defined corporate social responsibility (CSR) as “the responsibility of enterprises for their impact on society To fully meet their corporate social responsibility, enterprises should have in place a process to integrate social, environmental, ethical, human rights and consumer concerns into their business operations and core strategy in close collaboration with their stakeholders.” In this way, the terms “sustainability” and “CSR” assume similar meanings.

Moreover, the theory of stakeholders and the development of this theory point out that the firm lies at the intersection of many different and sometimes divergent interests. This is related to the many stakeholders involved or affected, directly or indirectly, by the firm’s decisions and actions.

The main challenge is to balance stakeholders’ interests and to be sustainable in the sense described above. The consequences of this new vision of a firm’s role are evident in the value chain configuration and in the way a firm pursues its competitive advantage. Presutti and Mawhinney (2013), for example, describe a situation in which a firm builds its competitive advantage by adopting a lean thinking approach. This results in a reduction of the inventory and in the need for prompter and more frequent procurement and deliveries. However, frequent shipments from suppliers and to the customer impact negatively on the environment, by causing traffic congestion and emissions. In this case, more efficiency in the firm conflicts with sustainability. If the enterprise takes into account the needs of the environment, it will explore opportunities to pursue efficiency but at the same time reduce its impact on the environment (e.g., by using hybrid vehicles).

Porter and Kramer (2006, p. 5) investigate the relationship between competitive advantage and corporate social responsibility, starting from the assumption that “a successful company needs a healthy society and a healthy society needs

successful companies.” These authors advise that a firm (and society as well) must focus more on the intersections than on the tensions between its goals and social interests. In their article, they study the implications of this for the value chain and at the strategic level. Regarding the value chain, which is the topic of this chapter, the authors consider the traditional value chain and indicate, for each primary or supporting activity, factors and examples of how environmental and social concern could affect the value chain.

As Fig. 4 shows, the abundance of areas in which a firm can consider CSR in its work suggests, in Porter and Kramer’s view, that a firm must build a strategy while facing up to its social responsibility by: (i) identifying the points of intersection with social needs, (ii) choosing

which social issues to address, and (iii) creating a social agenda. In this light, CSR is an “opportunity” to gain competitive advantage.

In their 2011 work, Porter and Kramer reinforce and enlarge this concept, by proposing their “Big Idea: creating shared value,” in an attempt to solve the trade-off between economic efficiency and social progress. In their definition, shared value refers to “policies and operating practices that enhance the competitiveness of a company while simultaneously advancing the economic and social conditions in the communities in which it operates” (Porter and Kramer 2011, p. 66). In describing the environment in which the firm acts, Porter and Kramer argue that societal needs define the market, and that weaknesses in society lead to internal costs for the firm. In fact,

Value Chain Management, Fig. 4 Value chain and CSR (Porter and Kramer 2006, p. 8)

in their view, social issues could impact on the company's productivity. They mention the environmental impact, supplier access and viability, employee skills, worker safety, employee health, water use, and energy use. Addressing societal concerns would improve productivity and generate a competitive advantage for the firm. In other words, an excessive focus on the optimization of the value chain without consideration of societal factors will lead to an underperforming value chain.

The authors view also this new approach as an opportunity to create competitive advantage. In fact, they underline the fact that creating shared value (CSV) is different from CSR. Shared value concerns profitability, competitiveness, and an internally generated agenda, while CSR is separate from profit maximization and originates from external pressures.

The authors suggest that a firm could create shared value in three interconnected ways: (i) reconceiving products and markets, (ii) redefining productivity in the value chain, and (iii) enabling local cluster development.

The topic of this chapter is the value chain. The authors give details about this idea, already described in Fig. 4, giving some examples regarding energy use and logistics, resource use, procurement, distribution, and employee productivity, and showing how firms like Marks & Spencer, Coca Cola, Nestlé, Johnson & Johnson, and Walmart achieved a competitive advantage by reshaping their value chain to incorporate social issues.

The environment, the needs of the community, and the social impact have to be embedded in the value proposition and consequently in the value chain, pursuing a win-win relationship.

The works of Porter and Kramer, especially the last one to be discussed above, have given rise to an intense debate among scholars and also among practitioners. On the one hand, many firms have taken inspiration from the "shared value" concept and try to apply the model in their own context, even if (Corazza et al. 2017) the meaning they attribute to "shared value" does not seem to be homogeneous among the cases. Moreover, as the approach originally refers to multinational firms

and developed countries, it does not fit well in "non-western" countries, such as developing and emerging countries (Voltan et al. 2017). On the other hand, many researchers have criticized the Porter and Kramer's model. Crane et al. (2014) recognize that the model has some strengths, but emphasize other weaknesses. Porter and Kramer's article successfully appeals to practitioners and scholars, partly because of the reputation of these authors in firms (Corazza et al. 2017). It contributes toward elevating social goals to a strategic level, and articulates a clear role for governments in responsible behavior. Moreover, CSV provides an umbrella construct, adding rigor to the ideas of "conscious capitalism." However, the shared value concept has some weaknesses. In the opinion of Crane et al. (2014), the concept is unoriginal and has already been considered (although not under this label) in the previous literature. In addition, in describing a win-win solution, the tensions between the economic and the social goal are hidden. For this reason, De los Reyes et al. (2017) emphasize that the approach poorly supports managers in win-lose situations. Another criticism regards the challenge of business compliance, because Porter and Kramer implicitly consider that the firm's behavior will be compliant with the regulations and moral standards, and this is not always the case. Finally, Porter and Kramer do not study the role of the firm in depth, resulting in a shallow conception. Similarly, Voltan et al. (2017), in their literature review, indicate four main areas of weakness in CSV: a lack of originality, its seductive nature, a tendency to oversimplify, and the naivety of some of its assumptions. Furthermore, some authors, especially those in the business ethics and CSR areas (Hartman and Werhane 2013; De los Reyes et al. 2017), point out that the model is incomplete and lacks an ethical framework.

This huge debate, which is summarized and somewhat simplified here, makes several relevant points clear. First, firms nowadays cannot ignore the issue of sustainability and the role that they can play in the global context. Second, even if all authors agree that sustainability is intertwined with the strategy and management of a firm, the relationship is more complex than an appealing

idea of a situation that is always win-win. Third, in this holistic view of the firm, the value chain remains the backbone of the whole organization and needs to be reshaped to take into account the impact of sustainability on the firm. As Presutti and Mawhinney (2013, p. 104) argue, “using a value chain model as a tool to identify the social and environmental impact of a firm’s activities can serve as a useful starting point to identify the interconnections between business and society.” In this vein, Fig. 4 gives evidence of the factors that affect the activities in the value chain. As described above, in an extended value chain the intersections and linkages between the value chains of different firms can enhance (or harm) value creation and often leads to a global value chain, which is a network of firms with different businesses located across the world. In a similar way, assuming that sustainability is part of the value proposition and of the firm’s strategy changes the boundaries of the firm. First, the enterprise must take into account relationships with more and different entities, such as government (national or local), authorities, and communities. In a broad sense, these organizations have their own value chains, focused on the creation of social value, or services for the community, etc. As in an extended value chain, the dialogue between the entities is also a dialogue between the value chains (Pesonen 2001). Second,

sustainability implies moving away from considering products from the “cradle to the grave” and toward considering, in a circular economy, products from “cradle to cradle” (McDonough and Braungart 2002). A value chain could create (or destroy) value during the entire life cycle of a product, from its concept and design to its disposal (or recycling). The so-called Green SCOR (Version 9 of the Supply Chain Operations Reference) introduced sustainability in the analysis of the supply chain and value chain, giving some guidelines for building and monitoring a sustainable supply chain (Closs et al. 2011; D’heur 2015).

The main issue is that sustainability should permeate the firm, starting with the strategy, and continue with the ideation of the products and then their realization, distribution, etc. D’heur (2015, p. 38) gives an effective representation of the approach (Fig. 5), which makes this concluding point clear.

Summary

The value chain is the backbone of a firm and, if properly managed, supports it in achieving competitive advantage. A good integration and coordination of the firm’s primary and supporting activities is a prerequisite for reinforcing the

Value Chain Management, Fig. 5 Value creation strategy (D’heur 2015, p. 38)

firm's position in the market. Supply chain management (SCM) is central in value chain management (VCM), but VCM has a wider impact. Nowadays VCM has evolved into extended (or global) value chain management and, more recently, to sustainable value chain management.

This implies that a firm has to consider its relationship within a global context and with firms and customers worldwide. Moreover, interconnections between the firm and social and environmental issues force the firm to rethink its strategy and therefore the value chain. A reconfiguration of the value chain and its efficient management strongly challenge the firm and depend on specific factors. The entire value proposition has to be reformulated, the dialogue within and outside the firm must be more intense, and the firm needs to abandon the silo approach. In addition, the exploitation of information systems, as well of the potential of digitalization, is necessary in supporting an efficient flow in the value chain.

Definition/Description

The Value Chain (VC) model was introduced by Michael E. Porter in his 1985 book *Competitive Advantage: Creating and Sustaining Competitive Advantage* (Porter 1985). The model is representing a firm as “a collection of activities that are performed to design, produce, market, deliver, and support its products” (Porter 1998, p. 36). A VC is industry specific, typically constructed on a business unit level. Nevertheless, even though there are similarities with an industry, the differences are key source of competitive advantage. The model is centered around a concept of value creation, as each value activity is analyzed to identify where exactly the value is created within the company. Companies continuously examine the value they create for their

customers to increase, or at least retain, their competitive advantage. Competitive advantage of a company cannot be understood by looking at the company as a whole, rather it has to be analyzed at the activity level. Consequently, the purpose of a Value Chain Management (VCM) is to increase efficiencies so that a company delivers maximum value at a minimum cost.

The Value Chain

The Value Chain (VC) is basic tool for systematic analysis of the company’s activities, which aims to identifying sources of competitive advantage. Activities in the VC are divided into two main categories: primary and secondary activities (please see Fig. 1).

Primary activities relate directly to creation of a physical product, sale, maintenance, and after-sale support. As the product is passing throughout all activities of the chain, it gains some value at each activity. The total added value is greater than the sum of independent activities’ values, and that is why customer is willing to pay for value activities and margin. Margin is being the difference between total value and the cost of performing value activities. Primary activities are divided into five generic categories, as follows:

- Inbound logistics: These are activities related to receiving, storing, and distributing raw materials and supplies within the company. The supplier relationship management (SRM) is an imperative in value creation in this category. The SRM typically helps companies to lower costs, improve quality, innovate faster, and through all this increase profitability (Liker and Choi 2004).
- Operations: These are transformational activities that convert inputs into outputs. Operations focus on running a business effectively and efficiently and include maintenance, material planning, and the analysis of production systems.
- Outbound logistics: It refers to transportation, storage, and delivery of product to customers. There are different ways to create value

Value Chain**Management II,****Fig. 1** The generic value chain (based on Porter 1998)

through the outbound logistics activities, but most prominent are responsiveness and visibility.

- **Marketing and sales:** These are activities associated with introducing a product to the customer and making it available to them. Sources of value are not just utility provided to customer, but also how value proposition is communicated to them. Some of the activities are sales, promotion, managing channels of distribution, managing relationships, setting prices, etc.
- **Services:** Activities aimed at preserving the value of products or services after they have been sold to the consumer. These activities include installation, training, supplying parts, modifications, and similar.

Secondary activities (please see Fig. 1), also called supporting activities, are necessary for smooth business operations. Procurement, technology development, and human resource management can support one or several primary activities; however, firm infrastructure supports the entire chain.

- **Procurement:** These are activities organization performs to get resources needed to operate. Included are vendor selection, negotiating favorable prices, and maintaining relationships with suppliers. Along with the logistics activities, they add values to the SRM. Although

purchased inputs are usually associated with primary activities, they are associated with every secondary activity as well. Creating value through procurement is well established (Presutti 2003), especially if deeper strategic relationships with suppliers are developed (Liker and Choi 2004).

- **Human resource management:** Activities include recruiting, hiring, training, motivating, rewarding, and retaining employees. People always create a lot of value, and business can have a clear competitive advantage with good human resource management (Han et al. 2019).
- **Technology development:** These activities relate to managing and processing data and information, as well as knowledge management. Companies are creating additional value through technologies like big data, mobile, cloud, social media, platforms, and similar. Benefits achieved through mentioned technologies include increased innovation (Yun and Yigitcanlar 2017), transparency and traceability (Francisco and Swanson 2018), improvements in production processes and supply chains (Nagy et al. 2018), increased efficiencies (Sabbagh et al. 2012), smarter products and services (Kiel et al. 2017; Raff et al. 2020), etc. The full potential companies are reaching by adopting digital platforms (Sandberg et al. 2020).
- **Firm infrastructure:** These activities are company's support systems and all functions

backing daily operations. Examples include accounting and legal department, general management, and similar. Company can use the infrastructure to their advantage in many ways.

The Value Chain Management

The value chain analysis is an integral part of the Value Chain Management (VCM). The Value Chain (VC) is quite generic and needs to be applied to a particular industry and specific company in order to define competitive advantage. When analyzing the VC generic categories are subdivided into more discrete activities, which reflect the specific approach a firm has developed. Number of value activities providing competitive advantage can be quite large, depending on the firm complexity. Yet activities that are little or no impact on competitive advantage are usually combined. Order of activities usually follows the process flow, but they can also be quite arbitrary. There are three activity types that differently influence competitive advantage, and each activity should be classified accordingly. Direct activities are directly involved in value creation for the customers. Indirect activities provide support to direct activities, and they are essential for performance of direct activities. Quality assurance exists to ensure quality of other activities. Hence, after the exhaustive list of activities is made, all activities are categorized by type. Next step is finding connections between all identified activities, as many are undoubtedly interrelated. Finally, all activities and linkages are reviewed to identify opportunities for improvement. These linkages are key to maximizing the value and increasing the competitive advantage through the VCM. The VCM also help us locate companies' core competences. Core competencies as such are foundations of company's competitiveness and sustainability, and they are used to seize the new opportunities (Oftedal 2013).

Summary

In this entry, the Value Chain Management (VCM) was presented. The importance of the

VCM was emphasized, given it is essential to understand how companies create value and understand sustainability. The VCM is highly practical and highly utilized by companies.

Definition

Value creation represents the main functions of an enterprise. Furthermore, recent studies have highlighted how stakeholders' well-being is influenced by business activities (Coronella et al. 2019). However, during the last years, the concept of value creation has been characterized by different reinterpretations. Specifically, the increasing attention paid by stakeholders to sustainable development and community well-being impacts value creation paradigms. Nowadays, value creation is not merely related to the concept of financial profit, but it is extended to additional items not related to financial performance like environmental, societal, and governance impacts. According to this evidence, defining value creation in XXI is more complex than in the past due to the exigence to create value for stakeholders and shareholders.

Value Creation and Sustainable Development: Origin and the Current Debate

Worldwide academics have historically analyzed the concept of value due to its central role in business and management's debate (Teti and Dallochio 2011; Coronella et al. 2019).

However, over time, the concept of value has been interested in several changes caused by historical, geographical, and political determinants.

The prior definition of value creation was proposed in the United States to identify the primary goal of enterprises (Teti and Dallochio 2011). Specifically, the first definition was provided by Drucker in 1954. The approach of Drucker was innovative because it redefined the concept of value. Specifically, prior studies assigned to profit the role of an enterprise's primary goal, while Drucker proposed an alternative perspective. From Drucker's perception, the profit represented only an effect of an adequate orientation to the market in terms of consumers' satisfaction. However, Drucker's contribution has not been followed in 1960 due to the development of a new orientation toward the markets. Drucker's proposal was influenced by the rise of the investments and the orientation toward a short-time profit from the managers. Contrarily, the orientation toward the market's exigence represented an activity characterized by a long-time orientation (Van der Stede 2000). The concept of value creation in that period was limited to only one category of stakeholders: the shareholders (Hansen 2012). The first conceptualization of "shareholder value" has been provided by US consultants in 1980 to define their services during a period characterized by financial markets' exigence to hire services to maximize their profits. However, firms oriented to create value only for shareholders were interested in several financial scandals. Furthermore, this period was characterized by unethical behaviors from managers.

The shareholder orientation was replaced by a new approach inspired by the exigence to create value for all stakeholders. The first definition of stakeholder value has been probably provided by Freeman (1984). However, recently some authors have highlighted how accounting scholars just considered the concept during the first half of the twentieth century (Coronella et al. 2019). The authors denoted how the enterprises cover a central role within the community. Furthermore, an enterprise's impacts are not limited to financial dynamics but even on nonfinancial items like pollution, citizen well-being, and human rights (Carroll 1984; Coronella et al. 2019).

According to this evidence, Teti and Dallochio (2011) have tried to formalize some of the main pillars that characterized firms oriented to the concept of stakeholder value:

- Adequate remuneration for employees
- Adequate work conditions
- Innovation in the supply chain
- Good relations with suppliers and buyers
- Nonfinancial reporting's transparency

Recently, Porter and Kramer (2011) have tried to identify a new concept of value. The authors' new concept is called "Created Shared Value" and consists of achieving the highest degree of connection between firms and stakeholders' interests. Specifically, the authors underlined firms' opportunity to adopt new business models to sustain both firms' value and both communities' well-being.

Summary

The Value creation definition is a complex concept due to the existence of different theories. During the last years, the increasing attention paid by stakeholders to sustainable development impacts all these theories. The role of academics in this process consists of identifying a new paradigm able to describe a possible definition of "value creation." On this point, the increasing number of nonfinancial reports prepared according to SDGs impose to update the latest definition of value to this new field.

Introduction to a Values Management System

The ValuesManagementSystem^{ZfW} (VWS^{ZfW}) is a management standard to “provide a sustainable safeguard of a firm and its development, in all dimensions (legal, economic, ecological, social)” (VWS^{ZfW}, p. 4). It includes a framework for values-driven governance through self-commitment and self-binding mechanisms. Values promote a sense of identity and give organizations guidance in decision-making. This is especially important in decision-making processes where topics are not clearly ruled by laws and regulations.

VMS^{ZfW} must be embedded in the specific business strategy, structure, and culture of an organization. The following four steps describe the implementation of the ValuesManagement-System^{ZfW}: (i) Codify core values of an organization, for instance, with a “mission, vision and values statement” or Code of Ethics, (ii) implement guidelines such as Code of

Conduct and specific policies and procedures, (iii) systematize these by establishing management systems such as Compliance and CSR management systems, and (iv) finally organize and establish structures to ensure the strategic direction and operational implementation and review of these processes. The top management shows that values management is taken seriously by their self-commitment to the core values of the company.

The ValuesManagementSystem^{ZfW} is a management standard applied by small, medium-sized, and large companies in Europe. It has been developed by the Centre for Business Ethics (Zentrum für Wirtschaftsethik – ZfW), a central research institute of the German Business Ethics Network (Deutsches Netzwerk Wirtschaftsethik – DNWE) (DNWE 2019) jointly with companies such as Allianz AG, BASF AG, and Siemens AG as well as organizations such as Novartis Foundation for Sustainable Development (for a full list of members, cp. VMS^{ZfW} p. 23). These business corporations and organizations are part of the Users’ Board for Values Management (Anwendererrat für Wertemanagement – AfW^{ZfW}), a voluntary association aiming at ensuring the quality of the management system.

Integrating Compliance and CSR in Management Systems

Compliance is characterized by legality and conformity. Compliance-related topics for companies are, for instance, the responsibility to comply with legal rules and regulations, fight against corruption, and ensure fairness in competition. Companies have to follow laws and legal regulations (hard law) and should follow – depending on their sphere of action – legal nonbinding recommendations and statements of international organizations and public authorities (soft law). Numerous soft law initiatives exist, among others the United Nations Sustainable Development Goals (SDGs) (United Nations 2015), principle-based initiatives such as the United Nations Global Compact (UN Global Compact), or certification standards such as Social Accountability International SA8000 (SA8000 2014) as well as

principles of good governance and international policies and procedures.

A closely related topic is Corporate Social Responsibility (CSR), the responsibility of enterprises for their impacts on society. Besides following hard and soft law, companies should have a process in place to integrate ethical, social, environmental, human rights, and consumer concern into their strategy and business operations. The aim of CSR is to identify, prevent, and mitigate their possible adverse impacts and to maximize the creation of shared value for their owners, other stakeholders, and society at large (European Commission 2011). CSR measurements can include responsible actions along the supply chain, such as the implementation of environmental and social standards and respect of human rights.

To ensure compliance and CSR in companies, increasingly companies establish Compliance management systems and CSR management systems. Both management systems have strategical and operational components (Table 1). On strategic management level, companies should integrate compliance and CSR in their strategy and business model or adapt their strategy and business model accordingly to ensure that that compliance and CSR will be considered in all management decisions. On operational management level, the focus lies in the systematical and continuous implementation of compliance and CSR by integrating compliance and CSR in all processes, structures, and control systems of the company.

Values Management System, Table 1 Strategic and operational components of Compliance and CSR management systems

Dimension	Components
Strategic	Integration in company values (e.g., “Mission, vision, values statement,” code of ethics)
	Integration in company strategy and business model
Operational	Integration in all company processes, structures, and control systems (e.g., code of conduct, operative processes, and incentive systems)

Source: Own illustration

Implementing the Values Management System^{ZfW}

Values-driven companies use management systems to integrate systematically compliance and CSR. In the following, the ValuesManagementSystem^{ZfW}, a standard for sustainable management, will be introduced (VMS^{ZfW}, pp. 1ff.). The ValuesManagementSystem^{ZfW} is based on the moral self-binding and self-control of corporations (Wieland 2003). Therefore, the VMS^{ZfW} must be embedded in the specific business strategy, structure, and culture of an organization.

The following four steps – step 1: codify, step 2: implement, step 3: systemize, and step 4: organize (see Fig. 1) – describe the implementation of the ValuesManagementSystem^{ZfW} (VMS^{ZfW}, p. 14).

Step 1: Codify

In the first step, it is important to codify the core values of the organization in a “Mission, Vision and Values Statement,” “Code of Ethic,” or another similar document. These fundamental values build the foundation of the organization’s strategy, structure, and culture. Values can be categorized into four groups: performance values (e.g., competence, performance, quality, flexibility, creativity, and innovation orientation), communication values (e.g., transparency, respect, agreement, and openness), cooperation values (e.g., loyalty, team spirit, tolerance for criticism, and open-mindedness), and moral values (e.g., integrity, responsibility, fairness, and honesty) (VMS^{ZfW}, p. 6). Companies declare their individual set of core values.

Step 2: Implement

The second step requires companies to create guidelines based on the core values and implement them through developing a Code of Conduct and policies and procedures, for instance, in employment contracts, job instructions, and assessment systems for management and employees (questions such as “What role does the Code of Conduct take in selecting personnel? Is it a criterion for assessment and promotion of

Values Management System, Fig. 1 Implementation of the Values Management System^{ZfW}. (Source: Cp. VMS^{ZfW}, p. 14)

junior staff members?") as well as supplier screenings and assessments (questions such as "Are suppliers selected according to a procedure that embraces criteria with regard to the principles and values of the codes?") (VMS^{ZfW}, p. 16 f.).

Step 3: Systematize

In the third step, the company can systematize their activities by implementing management systems, such as Compliance and CSR management systems with specific instruments (VMS^{ZfW}, p. 6; for details, see next chapter).

Step 4: Organize

The fourth step emphasizes, that the top management has to act as role models ("tone at the top") and demonstrate their personal commitment to VMS^{ZfW}. They are responsible to ensure the strategic direction and operational implementation of these processes, for instance, by establishing structures such as a compliance and/or CSR office (VMS^{ZfW}, p. 12).

VMS^{ZfW} evaluation procedures aims at documenting and verifying the process. Typically, organizations decide to self-evaluate their progress. In some cases, they ask for support of external institutions (VMS^{ZfW}, p. 21).

Instruments of Compliance and CSR Management Systems

To develop, implement, and review a values management system, various instruments are helpful. The following Table 2 provides an overview on elements for three stages: development, implementation, and review of Compliance and CSR management systems. Then examples of CSR and compliance instruments per stage are given.

1. STAGE: DEVELOPMENT (CPM^{ZfW}, pp. 18–21, amended and differentiated according to CSR and compliance-specific instruments)

I. Conduct Principles (Code of Ethics):

CSR and compliance instruments: Definition of company goals and company values; definition of the principles of business ethics; naming of key stakeholders; and identification of the applicable reference standards (CPM^{ZfW}, p. 18)

II. Conduct Guidelines (Code of Conduct):

CSR and compliance instruments: Legal compliance, law abidance; ensuring compliance with laws in collaborating with clients, suppliers, sales intermediaries, and subcontractors (CPM^{ZfW}, p. 18)

Values Management System, Table 2 Elements to develop, implement, and review Compliance and CSR management systems

Development	Implementation	Review
I. Conduct principles (code of ethics)	V. Leadership and corporate culture	IX. Audit
II. Conduct guidelines (code of conduct)	VI. Communication and training	X. Monitoring
III. Policies and procedures	VII. CSR and compliance in human resources (HR)	
IV. Transparency	VIII. CSR and compliance organization	

Source: Own illustration in accordance to CPM^{ZfW}, pp. 18–24

Compliance-specific instruments: Prohibition of corruption and antitrust law violations; acceptance and giving of benefits such as gifts and meal invitations; dealing with sponsoring, donations, and nonprofit activities; dealing with conflicts of interests; and protection of the assets of the company and business partners (CPM^{ZfW}, pp. 18 f.)

III. Policies and Procedures:

Compliance-specific instruments: Acceptance and giving of gifts; compliance declaration for managers and employees; compliance agreement for supplier and for third parties, e.g., review of suppliers, compliance declaration, and evaluation of suppliers; and sanctions in case of noncompliance (CPM^{ZfW}, p. 20)

IV. Transparency:

Compliance-specific instruments: Risk screening for sensitive business areas; control of risk management in sensitive business areas; documentation of sensitive payment transactions, e.g., donations and commissions; protection of IT systems against data manipulation; two-person rule in sensitive functions; and control of compliance with generally accepted accounting principles (CPM^{ZfW}, pp. 20 f.)

2. **STAGE: IMPLEMENTATION** (CPM, pp. 21–23, amended and differentiated according to CSR and compliance-specific instruments)

V. Leadership and Corporate Culture:

CSR and compliance instruments: CSR and Compliance as a strategy of sustainability; orientation toward ethical

values; managers take responsibility for compliance (“tone from the top”); leadership style: determination, clarity, reliability, accountability, and integrity; self-commitment, legality; and proactive communication of the management systems by company board and management (CPM^{ZfW}, p. 21)

VI. Communication and Training:

CSR and compliance instruments: Internal communication, e.g., meetings, brochures, newspapers, and intranet; external communication, e.g., annual reports, reporting, and brochures; written and oral information for agents, suppliers, and consultants; membership and engagement in CSR and compliance initiatives and exchange of experiences; and web- or intranet-based training for employees (CPM^{ZfW}, p. 22)

Compliance-specific instruments: Training for top-level management and specific training for functions with high-compliance risks, e.g., sales and procurement; trainings include legal information plus a focus on “real cases” (CPM^{ZfW}, p. 22).

VII. CSR and Compliance in HR:

CSR and compliance instruments: Integration into employee selection and hiring processes; career planning for board members and managers (CPM^{ZfW}, p. 23)

Compliance-specific instruments: Compliance declaration for employees in areas with increased compliance risks; target agreements in sensitive business areas; compliance risks in salary systems

and bonuses; and communication of disciplinary measures, e.g., sanctions in line with the law (CPM^{ZfW}, pp. 22 f.)

VIII. Organization:

CSR and compliance instruments: Responsibility of top management (board, management); CSR and compliance-steering committee, e.g., legal, audit, sales, HR, CSR, and compliance; and CSR and compliance office with appropriate resources (CPM^{ZfW}, p. 23)

Compliance-specific instruments: External compliance monitor; whistleblower systems (CPM^{ZfW}, p. 23)

3. **STAGE: REVIEW** (CPM, p. 24, amended and differentiated according to CSR and compliance-specific instruments)

IX. Audit:

CSR and compliance instruments: Control of compliance with and implementation of CSR and Compliance management system into everyday business practices (CPM^{ZfW}, p. 24)

Compliance-specific instruments: Internal audit of CSR and compliance management systems in sensitive business areas; control of sensitive payment transactions, e.g., donations and commissions (CPM^{ZfW}, p. 24)

X. Monitoring:

CSR and compliance instruments: regular reports to and discussion in the top management; self-evaluation of business areas and companies; and external monitoring of the implementation and continuous development of CSR and Compliance management systems by experts and auditing companies (CPM^{ZfW}, p. 24)

Effectiveness and Efficiency of Values Management Systems

Top management is obliged to check the VMS^{ZfW} effectiveness and efficiency. On the one hand, the

Values Management System, Table 3 Control of effectiveness and efficiency of values management systems

Phase	Possible Questions
1. Design check Development of Compliance and CSR management systems	Have all relevant compliance and CSR reference standards been considered? Is the design of compliance and CSR measures suitable for the company?
2. Functionality check Implementation or establishment of Compliance and CSR management systems	Are all required elements of the Compliance and CSR management system implemented?
3. Effectiveness check Application of the Compliance and CSR management system	In daily business, are the elements of the Compliance and CSR management system applied in all strategic and operational practices?

Source: Own illustration according to CPM^{ZfW}, p. 17

control ensures the quality of the management system and, on the other hand, continuous improvements due to dynamics in the business environment (VMS^{ZfW}, p. 22).

Typically, the top management checks their management systems such as Compliance and CSR management systems along the three phases of development, implementation, and application (CPM^{ZfW}, p. 17) (Table 3).

The effectiveness and efficiency of values management systems depend upon the continuous integration and implementation of compliance and CSR in the company's culture and into their structures and processes.

Synonyms

[Business angels](#)

Definition

Venture capital is the provision of venture or risk capital to a mostly young, fast-growing company whose business is characterized by high risk and a high degree of innovation. The aim of the investor is to maximize their own returns in a limited period of time. In addition to company shares, this usually requires far-reaching information, control, and codetermination rights.

Venture Capital – Introduction

Corporates need money and funding. Corporate financing includes a variety of types of financing: In addition to loans from banks, public subsidies,

and own funds, this includes the provision of capital by “private” (private investors, companies, etc.). In such “private equity” deals, equity is made available to companies that are not listed on stock markets, by private or institutional players.

If the capital is made available to young companies for a limited period of time, this is referred to as venture capital. Venture capital is therefore part of the “private equity” business.

Since the recipients of capital are usually not only young, but also mostly highly innovative and fast-growing companies with an increased risk of default and therefore investment, this is a special type of corporate financing.

Life Cycle Model of a Company

From the point of view of a company, different phases of corporate growth can be distinguished: Three phases of a life cycle model have been established (Müller et al. 2019, p 223 ff.):

- The first phase (“Early Stages”) includes the implementation of a business idea and the founding of the company. From the point of view of the young company, this is about finding the right idea and developing the first products and prototypes. At the same time, the focus is on building up the founding team. It must also be able to contact the first potential customers. The goal is to develop the company’s product or service to market maturity. It is important to prepare for market entry.
- The second phase (“Expansion Stages”) includes the growth of the company, including national and international markets. After successfully entering the market, the implementation of entrepreneurial steps begins with a view to providing products or services. In this phase, the focus is on market penetration to secure market shares and to consolidate one’s own competitive position. At the same time, the company’s network is strengthened by building relationships with customers, suppliers, or other companies. Depending on the business model, internationalization may follow.

- The third phase (“Later Stages”) includes a possible realignment of an established business model, possibly a restructuring or even a company succession. If crises occur because new competitors are entering the market, because the company cannot keep up with innovations or because of other obstacles, it may become necessary to realign the business model. If reorientation does not succeed, restructuring or consolidation is required. Under certain circumstances, the life cycle of the company ends with a successor and the handover from the founder to the next generation of entrepreneurs.

Financing Stages of a Corporate

Depending on the life cycle phase – early stages, expansion stages, and later stages – different types of financing can be distinguished (Müller et al. 2019, p. 224):

- Early Stages: Seed financing/start-up financing
- Expansion Stages: Growth financing/bridge financing
- Later Stages: Turnaround financing/restructuring financing/management buy-out (MBO), management buy-in (MBI)

There are different sources of financing for each of these types of financing. Depending on the phase of a business cycle, different sources of financing are suitable. Examples are the following: bank loans, guarantees, development loans, leasing and factoring, internal financing from own profits, or equity financing through the company’s own funds or through third parties. People who provide external equity financing can be, for example, business angels or venture capitalists who provide private funds.

Venture Capital

Venture capital providers are companies, funds, or private individuals (known as business angels) who provide so-called venture or risk capital for

a limited period of time. For this, they usually receive shares in a company. Companies that use such venture capital are fast-growing (usually very new) companies, usually start-ups, which often also have a highly scalable business model.

Investors demand a very high return for the provision of capital – especially in comparison to bank loans. This is due to the very insecure, risky business model and thus the risky investment, especially in these often very early phases of the company life cycle.

For the investor, there is an extremely high investment risk (including total losses) that, on the one hand, the investor is paid “well” (e.g., by the number of shares in a company that he receives for his participation).

As an incentive for their funds and to alleviate the risk of total loss if the business idea fails, venture capitalists seek control or influence on the company they invest in.

On the other hand, the investor tries to maintain influence through the design of contracts and control rights and to ensure that the company does not reduce its services after receiving the capital (and thus the probability of success of the company and thus – from the investor’s point of view – the investment): The provision of capital in stages based on milestones ensures the ongoing commitment of the company’s management. By helping to shape the business policy, strategic decisions can be made together with the management, and their performance can in turn be monitored.

The advantage for the company is the availability of free funds for business growth. Especially since classic debt financing is not suitable in such phases, or if an initial public offering (IPO) did not take place.

In addition to providing capital, venture capital providers are characterized by the fact that they also provide know-how in matters of entrepreneurship (management, product development, market penetration, etc.). The latter applies in particular when it comes to private individuals (business angels) who see a kind of mentoring model and a partnership with the young company as an important task.

The aim of the venture capital provider is (usually) to achieve maximum growth in the value of

their own investment after a few years. The increase in value is usually realized by selling the investment. These proceeds are usually the central earnings component of the investors. Possible ways of selling a stake are an initial public offering (IPO), the sale of one's own stake to strategic partners or companies, sale to another private equity player, or even a buyback by the company's founders.

Importance of Venture Capital and Criticism

Venture capital is an important component of corporate financing. Especially in early phases of the company's history or when other instruments are not possible or simply do not exist as a result of the business model. On the one hand, bank loans cannot be expected to a sufficient extent, for example, for young, fast-growing companies that have high growth rates but do not generate any profits. The debt service (interest and repayment) of a loan would also continue to burden the company's liquidity. On the other hand, own funds are rarely available to the required extent. Especially in capital-intensive areas with rapidly growing business models (technology, pharmaceutical industry, online business, etc.), venture capital is needed to provide these companies with capital for their highly innovative and at the same time risky projects.

When it comes to venture capital, it is criticized that it is simply about increasing market share and sales growth. In addition, the long-term, strategic orientation of the company in which an investor invests is not important. Building a "real" company is being sacrificed at the expense of "quick money."

Venture Capital and Sustainability

The aspect of corporate social responsibility (CSR) and sustainability is gaining in importance in the discussion about venture capital. The question here is whether, in addition to exclusively strengthening the financial resources of a company for entrepreneurial growth and thus the

highest possible return for the investor, other goals should also be pursued by the investor. The question of the effectiveness and purpose of the investment is asked. This connection is known as "impact investing." Impact investing is about investments that not only aim for a financial return, but also have a social or environmental impact on the company and its actions. With the help of the capital, a positive social and entrepreneurial contribution is to be made.

Summary

Venture capital is the provision of capital to young, fast-growing companies. Their business model is characterized by high risk. Investors want to maximize their own returns in regard to the high investment risk. Very often investors therefore try to maintain influence through the design of contracts or control right. Venture capital is very important as a component of corporate financing. Nevertheless, it is criticized, that it is simply about increasing market share or value of the investment instead of strategic and long-term orientation.

Venture Philanthropy

Andrea Cuccia
Department of Political Science and International Relations (DEMS), University of Palermo, Palermo, Italy

Synonyms

Angel philanthropy; Catalytic philanthropy; Enterprise philanthropy; Philanthrocapitalism; VP

Definition

Venture philanthropy (VP) comes as an indirect way of dealing with corporate social responsibility issues, since it calls for providing financial and nonfinancial support to organizations with societal purpose (SPOs), in order to increase their societal impact. VP applies venture capital principles (such as long-term investment and hands-on support) to charitable giving (Grossman et al. 2013; John 2006), and it recommends high engagement, organizational capacity-building, tailored financing, nonfinancial support, involvement of networks, multiyear support, and performance measurement (EVPA 2013, 2016, 2018; John 2006; OECD 2014).

Rise of VP as an Unprecedented Grant-Making Model

Grant-making model known as “venture philanthropy” (VP) is one of the most prominent and most controversial innovations breaking away from the old-fashioned ways of giving (Defourny et al. 2007; Moody 2008).

“Venture philanthropy” term was probably first coined in 1969 by the American philanthropist, John D. Rockefeller III, hinting at an adventurous approach to funding unpopular social causes, rather than an association with entrepreneurial business (Council on Foundations 2001; John 2006).

Only in the in the 1990s, VP approach definitely became established as a new form of highly engaged grant-making by foundations. Conceptually, the idea of VP found popular expression in 1997 with the publication of a Harvard Business Review article “Virtuous Capital: What Foundations Can Learn from Venture Capitalists” (Grossman et al. 2013; Letts et al. 1997; OECD 2014). This article urged philanthropists to resort to some of the methods of venture capital including due diligence, risk management, performance measurement, relationship management, investment duration and size, and exit strategy, in order to have a greater impact in addressing societal problems (Grossman et al. 2013; OECD

2014). At the same time, newly wealthy dot-com entrepreneurs-turned-philanthropists begun to take a growing interest in VP, whose intrusion into the social sector world was not always widely endorsed (John 2006; Koh 2010; OECD 2014; Reddy 2015).

In the UK, interest in VP was aroused through articles by Drucker – founder of Oxford Philanthropic – jointly acting with the support that the UK government has been giving to social entrepreneurship and social enterprise since 1997 (John 2006). Outside the UK, in continental Europe, there has been a slow but steady growth in interest in social investment and high-engagement models of philanthropy (EVPA 2018; John 2006). In particular, the upsurge of this interest has been due to the work of two European networks: The European Venture Philanthropy Association (EVPA) and the European Foundation Centre’s Social Investment Group (John 2006).

To date, at the European stage, VP/Social Investment (SI) sector has been continuing to grow. In particular, in fiscal year (FY) 2017, VP/SI organizations (VPO/SIs) have invested €767 million to support a total of 11,951 SPOs (EVPA 2018). VP/SI organizations have supported their investees not just financially, but also with a variety of nonfinancial support, ranging from strategic support and support to develop a Theory of Change to revenue strategy and human capital support (EVPA 2018). On the whole, economic and social development and financial inclusion have been reckoned as the two top sectors, attracting together more than half of the total investment reported for FY 2017 (56%), followed by education (12%). Concerning the beneficiaries, people suffering from poverty and children and youth have been detected as the most targeted categories, followed by people with disabilities and migrants and refugees (EVPA 2018).

Basically, there is a growing recognition from official aid agencies that private funders and investors, including foundations, are an important part of the global development architecture (OECD 2014).

Although venture philanthropists initially adapted high-level principles from investment industry players such as venture capital funds,

they have since developed specific investment tools, processes, and methodologies that have been adapted to work effectively in the social sector (EVPA 2013).

Generally speaking, new philanthropists take advantage of their experience from commercial enterprise and pursue scalable outcomes through the mobilization and leveraging of financial and nonfinancial resources (OECD 2014). These philanthropists are open-minded about the organizations and institutions they work with, whether for- or not-for-profits, and are willing to use a wider array of strategies, commercial, and noncommercial, to address development issues (OECD 2014). They build partnerships, work across multiple sectors, and take greater interest in outcomes and impact than in inputs and grant size (OECD 2014). Their new approaches have attracted a variety of names – angel philanthropy, enterprise philanthropy, catalytic philanthropy, and venture philanthropy – with the differences between them being more semantic than operational (OECD 2014). What the approaches share are operating principles of high engagement with beneficiaries (also known as partners, investees, or social purpose organizations, SPOs) and a willingness to combine a variety of financial and nonfinancial disciplines (OECD 2014).

Basically, VP industry seeks to complement existing forms of social finance and to contribute to the development of a more efficient capital market to support the social sector, especially working hand in glove with social entrepreneurs (Defourny et al. 2007; EVPA 2016; John 2006; Reddy 2015). As a matter of fact, the rise of VP has taken place in a context where the concepts of social enterprise, social entrepreneur, and social entrepreneurship (the “SE” concepts) have gained a foothold steadily (Defourny et al. 2007).

Currently, there are three major ways for individuals to engage in VP:

- Pooled funds: contribute to an organization already engaged and experienced in venture philanthropy.
- Staff a new entity: start an organization and rely on staff with the capacity to plan and implement the key practices of VP.

- Hands-on: invest in nonprofit organizations as an individual venture philanthropist (Grossman et al. 2013).

Venture philanthropists can provide financial and nonfinancial support directly, in case they may meet the needs of the supported organization by offering specialized services and financial means on their own. When venture philanthropists do not have the capacity to provide direct assistance or when they prefer not to play a direct role, they choose to provide funding and skills through a foundation or nonprofit entity, a fund, or a structure that incorporates both (Grossman et al. 2013). In this way, the foundation becomes the major partner of the SE (Grossman et al. 2013). VPs can also exist as companies or corporations that develop VP behavior to support social causes, as well as Government departments or public agencies may initiate a VP organization, but then they usually do it in partnership with other initiators (Grenier 2006; Grossman et al. 2013). SEs, on their part, must demonstrate to venture philanthropists that they understand and can articulate how they will achieve their outcomes – their theory of change – and how they measure their results (Defourny and Nyssens 2010, 2013; Reddy 2015).

Main Features of VP

Typically the VP approach helps smaller, growth-oriented charities and social enterprises to scale up their work and impact over a number of years (Koh 2010). Going in depth, first of all venture philanthropists develop long-term and close relationships with SEs, by making available financial and intellectual capital. Subsequently, they help the SEs become self-reliable and thus, eventually, do without their support (Frumkin 2017; Reddy 2015). In this sense, VPs also provide social capital by linking SEs to other SEs, so that they can support and can learn each other (John 2006).

Conventionally, VP key characteristics might be summed up as follows:

- Tailored financing by leveraging a variety of financial instruments (including grant-making and social investment).
- Provision of nonfinancial support during the lifetime of the investment to help SPOs build institutional capacity. In this sense, VP aims to provide advice in a range of areas such as human management and accountability, as well as it aims to promote organizational development before specific programs. Indeed, unlike grant-makers that trickle out support in small installments, the venture philanthropist seeks to get into projects with a large initial investment that signals real commitment (Frumkin 2017; Reddy 2015).
- An emphasis on performance and impact management.
- Multiyear support that means supporting a limited number of organizations for 3–5 years and then exiting when organization is financially or operationally sustainable (EVPA 2013).
- Leveraging additional financial or advisory support from the VP’s networks and peers.
- A strong emphasis on measuring and impacts and holding organizations accountable for achieving agreed upon outcomes (EVPA 2013, 2016, 2018; Grossman et al. 2013; John 2006; OECD 2014; Reddy 2015).

As shown by Fig. 1, VP comes as a methodology that is practiced at different stages of an organization’s development (Grossman et al. 2013).

While venture capital emerged as the early stage funder of innovation in a functioning capital market, evidence indicates that VP is not only an approach for funding early stage organizations but

is a way to enable scaling of more mature non-profits (Grossman et al. 2013). Indeed, although there is an emphasis on planning for sustainability and achieving large-scale impact even since the “angel” or “early stage” organizational development stages, venture philanthropists generally aim at fuelling long-term organizational development (Grossman et al. 2013).

Evidences suggest that the engagement period for any venture philanthropist ranges from 3 years to 5–7 years (EVPA 2013). Along the engagement period, VP is prepared to provide financial, intellectual (one might refer to this as human capital), and social capital to SEs. As opposite, SEs are required to show commitment to scaling their impact. Starting from the assumption that venture philanthropists cope with investment cycles, they are not likely to provide sustaining funding endlessly, aiming instead to bring SEs’ organizations to a scale that will allow them to access long-term funding streams from other more risk averse sources, once the investment cycle ends (Grossman et al. 2013; Reddy 2015). Hence, at the “long-term and large-scale impact” stage, SEs are expected to be able to succeed in the marketplace on their own (Grossman et al. 2013; Reddy 2015).

Summary and Future Directions

Venture philanthropy has been devised to provide supported organizations with a leverage effect, which may contribute weakening the typical philanthropic shortfall and leading them toward a sustainable operating model. Such an open

Venture Philanthropy, Fig. 1 Venture philanthropy across stages of organizational development (Grossman et al. 2013)

approach, more focused on outcomes than on types of incomes, tends to see sponsored organizations as hybrid ones, which have to secure the best mix of resources to support their social mission (Defourny et al. 2007).

The construction and diffusion of such a grant-making model have depended on influential opinion leaders who strategically have defined and advocated a new cultural repertoire geared toward claiming for its legitimacy and combining successfully new donors' practices with existing culture (Moody 2008). The institutionalization of such a grant-making model and its diffusion has depended also on communication and isomorphic modelling across networks (Moody 2008). On the whole, VP approach has spawned a language and some metaphors to convey the deep-seated desires of these new donors to have an impact and measure the effects of their philanthropy (Frumkin 2017; Gianoncelli and Boiardi 2017) (Table 1).

However, the language shown above has revealed itself as obtuse at times (Frumkin 2017). In fact, many of the investments made by venture philanthropist may look like just grants made by other donors (Frumkin 2017). Only a few of the most-high profile venture philanthropy investments represent substantial portions of the operating budgets of the nonprofit organizations on the receiving end (Frumkin 2017). Similarly, the idea of *consultative engagement* that many describe as a trademark of venture philanthropy is hard to distinguish from the diverse forms of mere *technical assistance* that donors have provided to nonprofits for decades (Frumkin 2017).

To date, hybrid finance might constitute the upcoming best way to finance societal impact through collaboration of multiple actors in the ecosystem (Gianoncelli and Boiardi 2017). Indeed, the creation of more hybrid finance mechanisms and structures may contribute to a more efficient allocation of the capital available for the social entrepreneurship field (Gianoncelli and Boiardi 2017). As hybrid finance becomes mainstream, the added value that hybrid finance brings into the VP/SI space will need to be assessed, looking in detail at how social enterprises and the society in broader sense benefit from these innovations (Gianoncelli and Boiardi 2017).

As more and more venture philanthropy funds spread out and as increasing numbers of donors pop up as social investors, it becomes crucial to pause and to ask about the underlying coherence of this model (Gianoncelli and Boiardi 2017). Surely, as already mentioned, a chief force behind this popular trend is the sincere desire of donors to see social change happen as a result of their giving (Frumkin 2017; Gianoncelli and Boiardi 2017).

Nowadays, formulating an exact definition for venture philanthropy might curb further evolution and, thereby, might be counterproductive, given that the willingness to try out new VP approaches and to learn from them are defying any strict codification (OECD 2014).

Nevertheless, it is necessary to reach out a widespread consensus upon those unique key aspects constituting the VP backbone in all respects. Indeed, only by rationalizing these widely accepted key aspects (first and foremost, the tailored multiyear financial and nonfinancial support devised to help the SEs build their institutional capacity and, eventually, to make them financially and operationally self-reliant) it becomes feasible to realize which levers can be toggled to fuel the VP approach upsurge and how to distinguish, also in practice, the VP approach from some other ones being developed, first of all the social impact investment stream.

Definition

Mozes et al. (2011) call corporate volunteering one of the most widely used types of CSR, which should be a strategic activity. Based on Kotler and Lee (2005), corporate volunteering means a volunteer-based program that can be implemented with the involvement of any corporate stakeholder, be it a current or former

employee, partner, or just a family member. According to Allen (2003), corporate responsibility is a solution to a problem for the community by attracting new talent and energy resources. In Wilson's (2000) definition, the essence of volunteering is that one person offers their time to another, person, group, organization without compensation (Shin and Kleiner 2003), which interpreted to companies, means that the company encourages its employees to sacrifice their time to participate in the local community (Lukka and Locke 2003).

The essence of volunteering is that the company supports and encourages its own employees, its partners, to volunteer, to donate their time and talent (Kotler and Lee 2005). However, Bussell and Forbes (2008) point out that the company only supports volunteering itself, but does not provide additional compensation or direct personal remuneration to employees in exchange for their volunteer work. Most volunteering activities are related to education, the environment, health and well-being, young or old groups, but typically companies also carry out such activities in local community organizations or on behalf of the local community (Kotler and Lee 2005). The voluntary effort of employees in a corporate social initiative that is linked to business goals is an important aspect. The strategic approach is expedient, so volunteering has to be connected with the areas already supported by the company and to be linked to the company's values and goals (Kotler and Lee 2005).

Introduction

Nowadays, most companies are increasingly seeking to involve their employees in CSR activities. One of the most common and popular forms of CSR is volunteering, which is gradually becoming part of business. However, the effectiveness of volunteering is greatly influenced by the commitment and active participation of employees.

Corporate volunteering is one of the most authentic forms of CSR. According to Bill Shore, the unique ability and contribution of

creative abilities of volunteering may be the most effective, meaning every company should help what they do best, arguing that core business volunteering is the most effective form of volunteering (Kotler and Lee 2005). Volunteering is the cleanest and most beneficial way for corporate involvement in society (Iamandi and Filip 2014). It facilitates cooperation between different sectors, making it easier for a company to integrate into social and environmental issues (VSA and RCS 2014).

Volunteering should be part of the business plan as it is done with the involvement of employees. It benefits all stakeholders, the company, the employee, and the community. It is also suitable for showing commitment to how committed companies are to their communities and their consumers in communities (VOLUM 2016). Through corporate volunteering, a company can become a positive organization in society (Muthuri et al. 2009; Gligor-Cimpoieru and Munteanu 2014).

Types of Corporate Volunteering

There are several categorizations of volunteering, as the possibilities for its realization are very diverse. The form of volunteering also depends on the abilities and talents of the volunteers. It can be in a formal or informal way. It can be initiated by the company, which is called company-driven program, or it can be initiated by the employee, which Pajo and Lee (2011) call employee-led program.

The type of activity itself can be: special technical support, lecture, workshop, organizational support, organizing and promoting fundraising events, providing spiritual support to people in need, entertaining older people, or organizing campaigns. Support can be expertise, talent, an idea, or physical work (Kotler and Lee 2005).

According to the form of organization, they can be: (Federația VOLUM 2014)

- Fully organized by the company
- Joint organization of the company and its related nonprofit organization

- Nonprofit organization without involving the company

In the first two cases, the voluntary program is implemented during working hours, in the third case it happens in free time; the employee decides on the basis of his/her choice in terms of time and activity.

Possible forms of volunteering are as follows (Kotler and Lee 2005):

- Encouraging employees to volunteer in the community and providing information about opportunities
- Helping in specific goals and organizations that are important for employees.
- Organizing volunteer teams for a cause or event
- Providing more alternatives for employees to find the right activity, such as site coordinator, site list, software
- Paid leave per year for volunteering is 2–5 days from working time, participation in major programs such as 1 year volunteering in developing countries
- A financial donation according to the number of voluntary hours spent by employees
- Highlighting the volunteer work in newsletters, awarding with plaques, mentioning at workshops and lectures

Motivations of Corporate Volunteering

An important factor in volunteering is that the company can maintain employee participation, so it is essential to see what internal and external motivational factors can help sustain corporate volunteering in the long run (Nave and do Paco 2013).

The underlying motivation may be altruistic on the part of the employee, so it is a selfless help, but there are also those who are motivated by egotism, to achieve individual reward and recognition (Dolnicar and Randle 2004).

However, there may be a number of other motivational factors behind volunteering, such as the nature of volunteering, the management of

volunteer programs, the achievement of a perceptible impact on others, the fact that one is doing something meaningful (Grant 2007). At the same time, autonomous problem-solving options appear to be one of the most important motivating factors for returning to volunteering.

Thus, there can be several reasons for volunteering (Clary et al. 1998):

- Values – responsibility to others from an altruistic, humanitarian perspective
- Understanding – learning new things, development of skills and competencies
- Social – development relationship and interaction with others
- Career – having new experience in other type of work
- Protective – having more positive feelings
- Enhancement – development in self-esteem

Advantages of Corporate Volunteering

Corporate volunteering has a number of benefits for the company, employees, and supported organizations.

From a company perspective, the following benefits are worth highlighting (Walsh 2005; Sanchez-Hernandez and Gallardo-Vázquez 2013; Păceșilă 2015, 2016; Kim et al. 2010; Peterson 2004; Gatignon-Turnau and Mignonac 2014; do Paço and Nave 2013; Zappala and McLaren 2004)

- Improving the image – consumers will have a more positive image of the company if they know they are acting responsibly
- Helping in meeting employee needs
- Professional performance can improve and develop
- Increasing overall job satisfaction
- Making a difference in the life of the company
- Strengthening the contribution to society
- Development of a healthy work environment
- Increasing in loyalty and commitment to the company, decreasing in turnover
- Increasing efficiency
- More interaction between employees, narrowing of gaps arising from hierarchy

- Increasing transparency toward the community
- Increasing trust, reducing mistrust
- Investing in the community
- Helping in achieve strategic goals (Allen 2003) – lower operating costs, shared value creation, higher profitability, increased consumer loyalty, impact on sales (LBG Associates 2005)
- Developing a more positive relationship with the community and the government

Many benefits can also be identified for employees:

- Increasing employee morale, volunteering simply makes the employee feel good
- Meeting people
- Acquiring new skills and abilities such as teamwork, communication (Allen 2003; Bartsch 2012; Paço and Nave 2013), which makes employees more skilled
- Special skills can also be developed for a company (Sgarciu 2011), such as time management, data collection, analysis
- Improving employee self-esteem (Allen 2003) as they create something useful and valuable to others
- Improving writing and communication skills, time management, planning, people management, leadership skills – amounts spent on employee training can be reduced (Caudron 1994)

For the community, the following benefits can be listed:

- Its contribution to poverty reduction
- Increasing well-being
- Establishment of social cohesion, increasing trust
- Recognizing and answering to community problems
- Strengthening civic thinking and communication in the community
- Generating similar initiatives among other organizations, etc.
- Connecting communities
- Raising awareness of the issue, needs, organization (Zhang 2011)

Summary

Challenges for companies related to corporate volunteering can be identified at several points:

- Recruiting and retaining volunteers, but not making it a must (Clary and Snyder 2002)
- Limited time for employee engagement – they prefer to take part in such activities, but the availability of corporate volunteering may not be the same as other volunteering
- Finding the right program – they can volunteer there, as defined by the company in its responsibility strategy – so that it doesn't have too little or a negative impact on the community (VSA and RCS 2014). If it doesn't meet the needs of the community, it will have fewer resources. Relationship can be broken between the two parties (Volunteering Victoria 2014). If an employee can choose the program, it cannot be racist, discriminatory, religious, or political, or in violation of public order
- Identification of NGOs capable of hosting volunteers – it is also a cost for an NGO, although not material as giving them work status and coordinate them. A detailed budget should be provided for the costs incurred for the whole program (Pro Vobis 2003)

At the same time, volunteering is challenging for employees, which also needs to be addressed by the company to unleash the comfort zone, to facilitate working in other new conditions through training, and to encourage networking with new people, communities, and organizations.

What companies need to pay the most attention to designing volunteer programs are the following ones:

- Maximum how many people can volunteer at one time to keep the company running smoothly
- Maximum how many hours of volunteering can be accounted for
- Who is entitled to volunteer (fixed-term, indefinite-term employment contract)
- Training of volunteers
- Proof of volunteering

- Recruitment of employees
- Organizing – to whom, when, and what is the task
- Leisure time, working time – spending their working time on volunteering or their free time. If it is paid time, then is it really voluntary? In the case of paid leave, the company contributes to the development of the community, the employee participates on his/her own initiative, therefore employee involvement in the community or employer-sponsored volunteering may be a better term
- The employee decides whether he or she wants to take part. If it is compulsory, it is no longer voluntary, it is more team-building or leisure, recreational activity
- All employees can participate in volunteering, but prior information is required – occupational safety training is mandatory
- The volunteering activity should be done with or without expertise?
- In return, they may receive financial or logistical assistance (CVE 2011), costs are borne by the company
- Recognition of employees before the company – more and more people are involved
- Evaluation, monitoring, and impact measurement of results is essential

Walker Review (2009) on Banks' Corporate Governance

Louise Gorman¹ and Anne Marie Ward²

¹Technological University Dublin,

Dublin, Ireland

²Ulster Business School, Ulster University, Newtownabbey, UK

Description

In response to the global financial crisis of 2008, Sir David Walker was commissioned by the UK government to conduct an independent review of the effectiveness of corporate governance in UK banks and other financial institutions with a view to making recommendations as to potential means of strengthening governance in the industry. Specifically, under the terms of reference of the review, recommendations were sought in the following respects:

- The effectiveness of risk management at board level including the incentives in remuneration policy to manage risk effectively
- The balance of skills, experience, and independence required on boards

- The effectiveness of board practices
- The performance of audit, risk, remuneration, and nomination committees
- The role of institutional shareholders in engaging effectively with financial institutions and monitoring of boards
- Whether the UK approach is consistent with international practice
- How national and international best practice can be promulgated

Among the recommendations of the resultant *Review of Corporate Governance in UK Banks and Other Financial Industry Entities* or *The Walker Review* was the creation of a *Stewardship Code* aimed at making management more accountable to institutional investors. This proposal was adopted by the Financial Reporting Council (FRC) for corporations in general. Consequently, in June 2010, the FRC replaced the *Combined Code* with the *UK Corporate Governance Code (2010)*. This chapter sets the background to the *Walker Review*. It proceeds with a précis of its findings and 39 recommendations. The chapter concludes by assessing the consequence of the *Walker Review* for the governance of financial institutions.

Background

As was the case in many countries, the financial services industry in the UK was severely impacted by the global financial crisis. State injections

of equity, takeovers of institutions, and significant liquidity support were key features of its aftermath. Corporate governance failures were widely recognized as having contributed to the financial crisis both in financial institutions in the UK and internationally. In particular, the ability of nonexecutive directors to protect the interests of shareholders in financial services institutions through prudent risk management and internal control was brought into question. Similarly, much criticism surrounded the appropriateness of directors' remuneration in the sector. In response, in February 2009, the UK prime minister appointed Sir David Walker to review corporate governance in the nation's banks in light of the considerable losses incurred in the banking sector during the crisis. Sir Walker's review was informed by over 180 written submissions from interested organizations and individuals. The review also held discussions with interested parties including board members of banks and other corporates, the accounting and legal professions, representatives of smaller shareholders, and representative of consumer interests. While focusing primarily on financial services industry, the recommendations in relation to engagement by institutional investors have wider relevance for shareholdings in all UK corporates. The review pays particular attention to questioning why different banks operating in the same country and in the same financial market and regulatory environment were impacted differently by the crisis. This difference is primarily attributed to the different approaches taken in the governance of, and by extension, the running of individual institutions. The recommendations of the *Walker Review* are intended to inform a governance framework that works in harmony with the regulatory system to ensure capital and liquidity adequacy.

Board Size, Composition, and Qualification

Despite guidance on induction, training, and development for executive and nonexecutive directors in the *Combined Code for Corporate Governance* (hereafter called the *Combined*

Code), the *Walker Review* is critical of the approach taken to induction, training, and development of nonexecutive directors in the UK banking and financial services industry. It notes that support is necessary to ensure nonexecutive directors have the requisite knowledge and understanding of the business to make an effective contribution. This is especially pertinent in aspects such as risk management where external training may be necessary (para 3.16). Thus, it is recommended that thematic business awareness sessions and substantive, personalized induction, training, and development be provided and reviewed annually with the chairman. Similarly, it is noted that executive directors should also be assured necessary training in the areas in which they have direct responsibility (recommendation 1).

Consistent with the earlier findings of the *Higgs Review*, the *Walker Review* reported concerns about the time commitment of nonexecutive directors. The review affirms that fundamental and intensive work must be performed in the areas of audit and risk management; hence the time commitment required from nonexecutive directors in the financial services industry is stressed (para 3.19). Thus, the *Walker Review* proposes that a minimum expected time commitment from nonexecutive directors of 30–36 days per year in a major bank board should be clearly indicated in letters of appointment so the appointees are made aware of the likely impediment this may present to their serving on boards elsewhere (recommendation 3).

The *Walker Review* also recommends a more hands-on approach by the Financial Services Authority (FSA). It notes that directors in financial institutions authorized by the FSA serve in a controlled function and must be pre-approved by the FSA. The *Walker Review* reports that in its approval, the FSA places substantial reliance on the judgment of the chairman and board of the financial institution. While it is acknowledged that the board's insight is likely to be well-considered, it is deemed appropriate that FSA encourages financial institutions to take their input still more seriously (para 3.24). Accordingly, it is recommended that the FSA's ongoing supervisory

process should give closer attention to the overall balance of the board in relation to the risk strategy of the financial institution, taking into account the experience, behavioral, and other qualities of individual directors and their access to adequate induction and development programs (recommendation 4). Furthermore, it recommends that the FSA's interview process for nonexecutive directors, proposed for FTSE 100 financial institution boards, should involve questioning and assessment by one or more senior advisers with relevant industry experience. It is envisaged that such advisers should be independent and may be engaged by the FSA for this purpose on a part-time panel basis (recommendation 5).

Functioning of the Board and Evaluation of Performance

The *Walker Review* considers that along with experience and knowledge, nonexecutive directors should have the personal qualities necessary to obtain clear and full answers from management (para 4.11). The review recommends that non-executive directors should be ready, able, and encouraged to challenge and test proposals on strategy put forward by executive directors. They should satisfy themselves that board discussion and decision-taking on risk matters are based on accurate and appropriately comprehensive information and draw on external analysis and input (recommendation 6). This reaffirms earlier proposals forwarded by the *Higgs Review*.

The responsibilities of the chairman in terms of determination of risk strategy and regular appropriate engagement with major shareholders are noted. The almost full-time requirement of this role is debated against the potential for the chairman's strong presence to increase his dominance (para 4.17). Thus, it is recommended that the chairman of a major bank be expected to commit a substantial proportion of his or her time (approximately two-thirds), to the business of the entity, with clear understanding from the outset that, in the event of need, the bank chairmanship role would have priority over any other business time commitment that the individual

may have (recommendation 7). Such commitment is not expected from a chairman of a smaller entity.

Past inadequacies in the experience of individuals holding the chairman position are noted (para 4.22), and it is recommended that the chairman should have both relevant financial industry experience and a track record of successful leadership capability in a significant board position. While both qualifications are preferable, the recommendation that the chairman has relevant industry experience can be relaxed, provided there is an adequate balance of relevant financial industry experience among other board members. However, convincing leadership experience should be prioritized (recommendation 8). Consistently, the chairman's responsibility is stated to encompass leading the board; ensuring its effectiveness; setting its agenda so that adequate time is available for substantive discussion on strategic issues; and ensuring that the directors receive all information that is relevant to discharge their obligations in accurate, timely, and clear form. In addition, the chairman's role is extended to facilitating, encouraging, and expecting the informed and critical contribution of the directors in discussion and decision-taking on matters of risk and strategy and promoting effective communication between executive and non-executive directors (recommendation 9).

A depth of consideration is given to the terms of board service. The need to hold directors continually accountable to shareholders via annual reelection is weighed up against the potential for such a practice to promote short-term-oriented attitudes (paras 4.23–4.24). In addition, the FTSE-100 norm of triennial reelections is considered, as is the extent of change taking place in the industry at the time (para 4.25). Against this backdrop, the *Walker Review* considers that it is potentially unsettling to recommend that all nonexecutive directors be reelected annually. However, given the importance of the capability and performance of the chairman, it is recommended that this position be subject to annual reelection (recommendation 10). Finally, a formal and rigorous performance evaluation of the board and its committees, with external facilitation

of the process every 2nd or 3rd year, with disclosure of relevant detail to shareholders is also recommended (recommendation 12).

The Role of Institutional Shareholders

The *Walker Review* evaluates communication between shareholders and the corporate. In particular, the review discusses the practice of selling shares when the bank or financial institution's investors have concerns with performance. The *Walker Review* concludes the sale of shares as "an uncertain influence on decision-taking by the board and a relatively blunt means of communication between owner and board" (para 5.21). The review considers the corporate should pay attention to shareholder behavior. Hence, it is recommended that boards ensure that they are made aware of any material cumulative changes in the share register as soon as possible (para 5.22). They should seek to understand as far as possible the reasons for such changes and satisfy themselves that they have taken steps, if any are required, to respond. Where material cumulative changes take place over a short period, the FSA should be promptly informed (recommendation 14).

By means of encouraging engagement with investors, it is recommended that a *Stewardship Code* be separated from the content of the *FRC's Combined Code on Corporate Governance* (recommendation 16). The *Stewardship Code* is recommended to be based upon the *Institutional Shareholders' Committee Code on the Responsibilities of Institutional Investors* (Institutional Shareholders' Committee 2002) but be akin to the *Combined Code* to the extent that it should be adopted on a "comply or explain basis" (recommendation 17) and overseen by the FRC (recommendation 18). To support commitment to the *Stewardship Code*, it is further recommended that the FSA require institutions that are authorized to manage assets for others to disclose clearly on their websites or in other accessible form the nature of their commitment to the *Stewardship Code* or their alternative business model.

The *Stewardship Code* promotes collective engagement by institutions where appropriate (principle 5). The "concert party" rules of the *Takeover Code*, however, pose a potential barrier to such commitment. In effect, institutional investors in the UK may be reluctant to take collective action due to the possibility of being considered be acting in concert by the UK Takeover Panel and thus being subject to the requirements of the mandatory bid rule of the *Takeover Code* (rule 9). To ease investors' concerns that collective engagement may lead them to be considered as parties acting in concert, thereby potentially contravening the rules of the *Takeover Code* and the FSA, both parties are encouraged to keep under review the adequacy of "safe harbor" interpretation and guidance (recommendation 20). The review takes the stance that voting and disclosure of voting policies and outcomes by institutions are an element of good governance (para 5.51) and recommends that voting powers be exercised and that fund managers and other institutional investors make relevant voting disclosures in statements on their websites or in another publicly accessible form (recommendation 22).

Governance of Risk

The *Walker Review* notes that enhanced statutory, accounting, and other standards concerning the preparation of financial statements combined with the need to review and report on the effectiveness of internal controls place a heavy regulatory burden upon audit committees (para 6.11). It stresses the potential or actual overload of the audit committee and the need for a closely related but separate capability for risk management (para 6.12). The "fundamental" prudential risks of the institution, leverage, liquidity risk, interest rate and currency risk, credit/counterparty risk, and other market risks are distinguished from other "major" prudential risks, operational, information technology, compliance, and reputational risk, the former requiring dedicated focus (para 6.12). Consequently, it is recommended that the board of a FTSE 100-listed financial services company should establish a stand-alone board risk

committee with responsibility for oversight and advice to the board on the current risk exposures of the entity and future risk strategy, including strategy for capital and liquidity management, and the embedding and maintenance throughout the entity of a supportive culture in relation to the management of risk alongside established prescriptive rules and procedures. In preparing advice to the board on its overall risk appetite, tolerance, and strategy, the board risk committee should ensure that account has been taken of the current and prospective macroeconomic and financial environment drawing on relevant financial stability assessments of authorities including the Bank of England and the FSA (recommendation 23). The committee's remit should extend to due diligence assessment of proposed acquisitions, disposals, and other such transactions (recommendation 26). A report of the committee, to be included in the annual report and financial statements, should describe the corporate's strategy in a risk management context, including information on the key inherent risk exposures, the associated risk appetite, and tolerance for risk. It should explain how the actual risk appetite is assessed and provide information on the scope and outcome of the stress-testing program. Finally, the report should disclose membership of the risk committee, frequency of its meetings, and sources of external advice sought (recommendation 27).

The *Walker Review* advises that a chief risk officer (CRO) be appointed. The CRO should participate in the risk management and oversight process at the highest level on an enterprise-wide basis and have a status of total independence from individual business units. Alongside an internal reporting line to the chief executive officer or chief financial officer, the CRO should report to the board risk committee, with direct access to the chairman of the committee as is necessary. The CRO should have the resources necessary to assess, independently of executives and with due regard to materiality, whether proposed products or transactions are consistent with the risk tolerance determined by the risk committee and board and should be able to exercise a power of veto where necessary. On a continuing basis, the CRO

should seek to ensure that risk originators in individual business units within the entity are fully aware of and aligned with the board's appetite for risk. The evaluation of current practices undertaken by Walker's research team uncovered that CROs experienced resistance to their role. In light of this finding, the *Walker Review* emphasizes that members of financial institutions engaging in seemingly risky business should not challenge the CRO's authority if such business is deemed to extend beyond the institution's risk appetite. The tenure and independence of the CRO should be underpinned by a provision that removal from office would require the prior agreement of the board. Finally, the remuneration of the CRO should be subject to approval by the chairman of the board or the chairman of the board remuneration committee (recommendation 24).

Remuneration

It is widely acknowledged that, prior to the crisis, remuneration and incentive schemes in the banking sector contributed to the creation of a culture of risk-taking. The *Walker Review* notes that while guidelines on best practice in corporate governance advise the remuneration committee to determine remuneration policy and packages for board-level executives, remuneration committees' role in this regard ought to have a wider scope in the financial services sector given the systemic and economic significance of the risks which may be influenced through performance-related pay (para 7.7). In particular, it advises that the remuneration committee should have sufficient understanding of the financial institution's policy on pay and employment conditions to ensure that it is adopting a coherent approach to remuneration in respect of all employees (recommendation 28). Moreover, the terms of reference of the remuneration committee should include oversight of remuneration policy and outcomes in respect of all high-end employees (recommendation 29), and it should explain the principles underlying the performance objectives, risk adjustments, and the related compensation structure for high-end employees, if these differ

from those put in place and disclosed in respect of executive board members. "High-end employees" refers to individuals who perform a significant influence function for the financial institution or whose activities have, or could have, a material impact on the risk profile of the financial institution (para 7.10). Potential issues regarding the impact of such disclosures on international comparisons are considered (para 7.20), and it is recommended that for FTSE 100-listed banks and comparable unlisted financial institutions, the remuneration committee report should disclose in bands the number of high-end employees whose total expected remuneration in respect of the reported year is in a range of bands and, within each band, the main elements of salary (recommendation 31). The threshold level for these bands starts at £1 million (Slaughter and May 2009).

The *Walker Review* suggests that deferral of an element of high-end remuneration may serve as a primary means of risk adjustment of pay and serve as a long-term incentive mechanism (recommendation 33). The *Walker Review* rationalizes that the remuneration of such employees ought to be adjusted to account for risks which may be encountered in the pursuit of performance benchmarks such as revenues and market share (para 7.36). Specifically, consideration is given to an arrangement whereby a component of variable high-end remuneration would have a vesting period of a number of years. Full endowment would follow at the end of the vesting period, when the impact of risk-taking is realized. The review, however, acknowledges that financial institutions may engineer remuneration packages to avoid the deferral of contingent bonuses. In particular, it predicts that financial institutions may respond by remunerating high-end employees through fixed pay. This would have negative consequences for the financial institution as it would increase fixed costs and reduce profits. The overall implication is that UK financial institutions would be less able to compete internationally (para 7.26). Hence, it is advised that deferred remuneration structures be adopted on a "comply or explain" basis. This means that shareholders can evaluate reasons for deviation (para 7.31). It

is further recommended that short-term bonus awards be paid over a 3-year period with not more than one-third in the 1st year. The *Walker Review* also recommends that financial institutions be able to reclaim bonuses paid in circumstances of misstatement and misconduct (recommendation 33). The conventional measure of aligning managers' long-term interests with those of the shareholder by means of share ownership is deemed to remain a fundamental element of compensation; the *Walker Review* stated that executive board members and high-end employees should be expected to have "skin in the game" (para 7.35). Therefore, the review recommends that executive board members and high-end employees should be expected to maintain a shareholding or retain a portion of vested awards consistent with their total compensation. This vested interest is to be built up over a period at the discretion of the remuneration committee. Further, the review recommends that vesting of stock should not be accelerated on cessation of employment, other than on compassionate grounds (recommendation 34).

The *Walker Review* highlights that the existing practice of presenting the remuneration committee report at the annual general meeting should continue, even though the report is subject only to an advisory, non-binding resolution (para 7.38). The justification provided is that manager remuneration is addressed in managers' contracts of employment that are implicitly or explicitly approved by shareholders. Therefore, at the appointment stage, shareholders have an opportunity to ensure that the manager's remuneration structure is consistent with the interests of shareholders. Nonetheless, it is deemed important that shareholders are provided an opportunity to exert their influence on occasions, where they have concerns regarding the remuneration granted to management. The *Walker Review* suggests that the best feasible means of enabling shareholder influence is when the non-binding resolution on a remuneration committee report attracts less than 75% of the total votes cast at the annual general meeting, the chairman of the remuneration committee should stand for reelection in the following year irrespective of his or her normal appointment

term (recommendation 36). It is pointed out that over the course of the year prior to the remuneration committee chairman's reelection, there should be good opportunity for shareholder engagement with the board regarding remuneration matters (para 7.41).

The *Walker Review's* treatment of remuneration concludes by emphasizing the need for remuneration committees to have access to high-quality external advice (para 7.53). In respect of this external advice, the review welcomes the Remuneration Consultants Group's work on a draft code of practice for external remuneration consultants (para 7.54). The review suggests that this code should provide the basis for the determination of the remuneration committee's terms of engagement with its external adviser (para 7.57). To facilitate engagement between remuneration committees and remuneration consultants, the *Walker Review* recommends that remuneration consultants, as a profession, put in place a formal constitution with provision for independent oversight and review of the remuneration consultancy code; that this code and an indication of those committed to it should be lodged on the FRC website; that all remuneration committees should use the code as the basis for determining the contractual terms of engagement of their advisers; and that the remuneration report should indicate the source of consultancy advice and whether the consultant has any other advisory engagement with the financial institution (recommendations 38 and 39).

Conclusion

The *Walker Review* was a prompt response to the deficiencies in banks' and other financial institutions' corporate governance systems highlighted by the financial crisis. The approach taken in the *Walker Review* to governance is distinctly shareholder-oriented. While the interests of various other stakeholders in banks and related institutions are accounted for, the factors more closely associated with systemic and economic risk are largely left to the national and international financial regulatory systems. Indeed, the capacity of

such a shareholder-centric set of recommendations to constrain undue risk-taking by banking executives has been questioned, given that equity holders commonly have similarly high-risk appetites (Deakin 2010; Bruner 2011). The link between remuneration and risk-taking is thoroughly addressed. However, there is a view that the *Walker Review* did not go far enough and that the review should have suggested a cap on bonuses; however, the clawback provision proposed may be considered more conducive in incentivizing and rewarding prudent management performance. It is also consistent with measures proposed in the USA under Section 954 of the Dodd-Frank Wall Street Reform and Consumer Protection Act (2010) (Public Law 111-203). In a general sense, the *Walker Review* marked a turning point in the UK's approach to governance such that the introduction of the *Stewardship Code* by the FRC was the first bona fide initiative to assist institutional engagement with investee corporations since the publication of the *Review of Institutional Investment in the United Kingdom* (Myners 2001).

The published report received a mixed reaction (Slaughter and May 2009). The media, in particular, considered that the recommendations did not go far enough that Walker had the potential to suggest a major shake-up of banking governance but instead opted for "tweaks" to already existing corporate governance recommendations (Finch 2009). Therefore, the recommendations made are not considered to be unduly reactionary or cautionary, given the environment of uncertainty in which they were constructed. The *Walker Review* came under criticism for not going far enough in promoting transparency. For example, the review recommends that financial institutions disclose the number of "high-end" employees earning more than one million per year, with bands for higher earners. In addition, the report provides no justification for the one million figure. In his defense, Walker argues that the provision of such detail may result in increased salaries and enable rivals to head hunt (Finch 2009).

The *Walker Review* is considered one of the most commanding sets of recommendations on corporate governance practice in the UK (Gibson

Dunn 2009). It contrasts previous reviews in terms of the level of flexibility offered to boards. Yet, in light of the risks entailed in banking and the necessity to create a culture of prudence in the interests of the shareholder and indeed of society more generally, a more rigid framework serves to avoid future losses of the scale experienced during the crisis.

Waste Dumping

Amos Owen Thomas

Definition/Description

The international trade of waste encompasses everything from household trash to industrial chemicals. Its growth has been fostered by the increase of waste production worldwide with economic growth, more stringent environmental laws particularly in the developed world and the developing world’s need for investment capital. Trading in wastes has been quietly included within free trade pacts between developed and developing countries, in contravention of

international banning treaties like the Basel Convention. Given the directionality of the trade from the developed to the developing world, it is important to tackle the issue of export, transit, storage, and disposal of such wastes produced, whether currently or in the past. Though the ultimate question to be addressed is how more sustainable production, less toxic by-products, and efficient upcycling can be achieved in the future.

Definition and Research

The waste trade typically involves shipping wastes from developed countries to developing countries with adverse consequences for the environment of the latter and the health of their peoples. The trade encompasses everything from household trash to industrial chemicals. Its growth is fostered by the increase of waste production, the more stringent environmental laws in the developed world and the developing world's need for capital. No less lethal than dumping of solid toxic wastes on land is the pollution of the air and water that then travels across the globe. Most research on this trade appears to be published by the biological, health, and chemical sciences and in the environmental engineering, rather than in the management and the social sciences. The former's focus is on the consequences and remedies, rather than penalization or incentivization of culpable organizations, business, or government, which profit from this trade.

History and Trends

Dumping wastes has a long history dating from colonial countries dumping industrial wastes along shipping routes to and in their colonies to the post-World War II period of the military dumping surplus chemical and biological weapons in oceans. Only when multinational oil companies, prohibited by law from dumping wastes around the Gulf of Mexico, commenced incinerating wastes and exporting the ash to developing countries was there impetus for the comprehensive Basel Convention. Deeming

transborder movement and disposal of hazardous waste as a crime, the Convention requires signatory countries to monitor, enforce, and prosecute. But the lack of resources to regulate the trade particularly in developing-emergent economies is exploited by traders dealing with wastes from industrialized countries through bribery, false documents, and outright smuggling. Furthermore for some developing countries, economic benefits of the waste trade seem to outweigh the environmental costs.

While laws on waste collection and disposal in the developed world are based on notions of sustainable production consumption, few equivalents exist in the developing countries to which such wastes are transported ostensibly for recycling. As the destination of much hazardous waste exports the nations of the Organisation for African Unity (subsequently the African Union) had drafted the Bamako Convention. However, its focus on the reduction of waste production may be irrelevant because most waste is generated in other continents. Advocates for this trade see cooperation between industrialized and developing economies as a means of environmentally sustainable waste management globally. So provisions for trading in wastes have been included within bilateral trade agreements in contravention of international treaties.

Forms and Alleviation

Electronic wastes: Generation of e-waste is expected to rise by 2 million tonnes (Mt) per year, thus reaching 50 Mt by the late 2010s. Although Asia generated the most e-waste at 16 Mt, on a per capita basis, Europe generates the highest e-waste at 15.6 kg per person though that may reflect greater monitoring of collection and measurement. About a quarter comes from devices like smartphones and computers, while appliances like refrigerators and air-conditioners making up the rest. For communities involved in their recycling in developing countries, exposure to chemicals such as lead and mercury, air pollution from fumes and dust, and contamination of water and food have negative health

consequences. Yet recycling could contribute to sustainability via reconditioned products, replacement parts, and remanufacturing as new products.

Industrial wastes: All industrial processes generate waste and those that affect air and water are often removed within the factories themselves. Still, that can result in solid wastes like the slags, sludge, and dust such as generated by the steel industry. Coal mines, in developing countries particularly, dump solid waste as side-hill fill which together with the blasting and transportation cause dust emissions into the air, contaminated water from surface flows and seepage causing stability risks. Environmental legislation worldwide has discouraged dumping in landfills and encouraged treatment of industrial waste for reuse. Research on materials recovery could reduce costs, enabling industrial production to be both competitive and sustainable.

Construction waste: Whether contributed by natural disasters, infrastructure development, demolitions of illegal construction, household modifications, deterioration from poor labor or materials, construction materials are the major source of waste worldwide. Regulations on reuse of construction and demolition wastes may exist but as these are seldom implemented without there being a market for used building materials. Stakeholders in construction waste management include profit-oriented developers, contractors, site managers, engineers, and suppliers, as well as the sustainability-conscious government departments. Educating householders against unnecessary renovations, training contractors on quality construction, encouraging use of recycled materials, and provision of sufficient landfills for unrecoverable waste are all needful for sustainable management of construction waste.

Municipal waste: Greater urbanization, better living standards, and increased consumption invariably results in greater trash. Though inadequate collection and uncontrolled dumping has led to environmental and health issues such as dioxin and similar chemicals being found in the breast milk of women living near municipal dumping grounds in developing countries. Often lack of sanitation facilities especially in the rural

areas results in uncontrolled household waste polluting the water and land, affecting adversely communities in close proximity. Food waste pretreatment has global warming potential, but processes have tended to be based on considerations like economy and practicality. To ensure sustainability, governments have to deal with this waste through a combination of measures like source reduction, collection, recycling, composting, incineration, and landfills.

Summary

Although a global treaty regulating the waste trade exists, this is perceived by industry and civil society as weak in enforcement, as demonstrated by periodic news reports of toxic dumping post-hoc. It is imperative to tackle the issue of export, transit, storage, recycling, and disposal of such wastes produced currently or in the past. Considered mundane, waste management mobilizes the public and politicians only when events like landfill leakage, siting of dumps and dust from incinerators make the news. Yet resource scarcity and efficiency has generated interest in reuse, remanufacturing, and recycling such as of alloyed steel in component manufacture. Losses of materials and functionality can be considerable in recycling processes, but there are also opportunities for reduced material use through remanufacturing which has benefits for environmental sustainability. Given the negative impact of wastes on both the industrialized-developed and the developing-emerging world, what is crucial is ensuring that less toxic products and by-products are produced in the future.

Definition

A colorless, transparent, and odorless liquid and one of the most valuable assets on the planet, vital for humans and to ecosystems, and is an important resource in all areas of human life.

The Importance of Water Research

“Clean Water and Sanitation” is the sustainable development objective 6 that must “*ensure availability and sustainable management of water and sanitation for all*” (UN 2021). Thus, the importance of water is justified on its origin of life. It is the most abundant element on the planet, contains many nutrients and minerals, and is of primary importance in human life (Schmidt, 2017; Versari et al., 2002).

Water is considered a vital part of the human diet. According to the World Health Organization (WHO), hydration is indispensable to human life. To maintain the body’s cell function, it is essential to regulate the amount of water in the body (Perrier et al., 2020).

According to the public information of the World Health Organization (WHO), each person needs between 50 and 100 liters of water, per day, to ensure the most basic needs, then health problems are minimized (WHO, 2015).

The total body water balance is the result of the balance between losses and the water intake. To maintain this balance, which is an essential condition to life, we must daily ingest an adequate amount of water, preventing the loss of moisture in the skin (PIANSMW, 2017). And if there are several ways to lose body water, there are only two ways to obtain: produce water via the metabolism and drink water. Metabolic production generally results from most of the oxidation reactions caused by nutrient metabolism (WHO, 2015).

The human body needs a series of mineral elements to play correctly their functions. The consumption of two liters of water a day represents contributing with more than 20 minerals and trace elements to the functioning of our body, which is equivalent to responding to between 5 and 8 percent of daily needs (Perrier et al., 2020).

Water is the most important molecule worldwide and covers most surfaces below atmospheric conditions. It is present in several states, such as vapor, liquid, and several amorphous and crystalline phases (Malenkov, 2009; Petrenko & Whitworth, 2002).

Planet Earth has two-thirds of its surface occupied by water – they are approximately 360 million km² out of a total of 510 million. However, 98% of the water available on the planet is salty. Only 3 percent of the water on the earth is fresh, and of this, more than 2 percent is locked away in the polar ice caps, glaciers, or deep groundwater aquifers and is therefore unavailable to satisfy the needs of man. Furthermore, *“less than 100,000km², just 0.3% of total fresh water reserves on earth”* is found in rivers, lakes, and swamps and is sufficiently accessible to be considered a renewable freshwater resource (Gleick, 1993, p. 3).

There are multiples uses of water, such as drinking; domestic supplies; supply industrial; agriculture; recreation and leisure; power

generation; navigation; slop dilution; landscape harmony; preservation of fauna; preservation of flora; and irrigation, among others (Marengo, 2008).

This valuable resource must be used for the benefit of Human without compromising the needs of ecosystems and the continuity of water-courses. Its economic value increases geometrically, but its availability decreases. Water fulfills multiple functions, and it is instilled with numerous meanings: It is concurrently an economic input, an esthetic reference, a religious symbol, a public good, a fundamental resource for public health, and a biophysical need for humans and ecosystems (Barnes & Alatout, 2012).

The growth and evolution of human culture and civilization have had a strong relationship with water resources. Ancient civilizations, such as the Egyptians, Romans, Venetian Empire, and the Omayyad dynasty, were all based upon sustainable water resources, which helped them to survive and thrive. The sustainability and development of past, and present, human societies have been conditioned by advances in water science, and by their use through engineering and technology (Seyedeh et al., 2021).

In fact, all living beings are fundamentally composed of water. Today, as in the past, citizens depend on water, either to evolve or to survive daily. Water is indispensable to life; without water, there is no life, at least in the form with which we know it. The so-called water cycle occurs then to preserve life. The Sun, as a great biological engine, evaporates the water from the seas and oceans, which in vapor form will constitute the clouds in the atmosphere. Upon returning to Earth in the form of rain or snow, water is distributed over the continents (PIANSMW, 2017). As Mishra and Dubey (2015, p. 325) argue *“humans depend on it. While demand –increases, supply clean water are diminishing due to mounting pollution of inland water ways and aquifers.”*

The earth's hydrological cycle links interactions between the atmosphere, lithosphere, biosphere, and anthroposphere, and it is also profoundly affected by human activities and socioeconomic development. With recent rapid

changes in climate and land use, the global water cycle is experiencing high levels of spatial and temporal variability, which has resulted in numerous water-related issues that pose challenges to human water security (Braga et al., 2014; Wang et al., 2010; Xia et al., 2017).

Summary

Water is the fundamental natural resource that supports life, ecosystems, and human society (Yang et al., 2021). Life on earth descends from water, and water is the lifeblood of our planet. Existence, and prosperity of the mankind, depends on access to safe water, and access to water has been the key to any sustainable civilization (Seyedeh et al., 2021).

Water is at the heart of sustainable development because it helps to reduce poverty, enables economic growth (imagine agriculture without water), and safeguards the environment (see nature reserves and the forest-run economy). From food to human and environmental health, water contributes to the improvement of social well-being and the growth of citizens and all living beings (Marengo, 2008).

However, water supply is finite and increasingly uncertain given the likely impacts of climate change and an increased demand for water as population increases, and agricultural and industrial activity expands (Bjornlund et al., 2013). Concerns are also escalating about water quality and the health of riparian ecosystems (UN, 1997).

The truth is water is used everywhere in people's daily lives and has a key role in the modern economy. Therefore, it is possible to guess that sustainable water management is one of the greatest challenges that man will face during the twenty-first century (Akamani & Wilson, 2011).

Definition

Water problems address the lack of access to safe water supplies that requires a multi-dimensional approach, including water infrastructure investments, water management improvements and conservation, education, and awareness-raising programs to promote good hygiene practices and safe water use. It also expects political influence which will promote a cross-sectorial collaboration to ensure that water resources are managed sustainably and that the needs of all stakeholders are considered. In places or countries where water resources are scarce or unreliable, stakeholders may struggle to meet their basic needs for drinking, cooking, and sanitation. All these aspects could face a range of water-related diseases, such as cholera, typhoid, and dysentery, which can be life-threatening, particularly for vulnerable populations such as children, the elderly, and those with weakened immune systems and, especially, faces several negative impacts on human health, economic development, and social well-being.

What Are the Water Problems?

Currently, humanity faces problems with a complex dimension, caused by climate change. The impacts of climate change associated with water problems are very diverse from country to country and between regions due to the characteristics of each territory, variations in seasons, and the economic activities of each region and population (WHO 2002). The changes and impacts already noticed have brought high economic impacts and loss of human life in many areas of planet Earth. Projections related to climate change are increasingly worrying and alarming, especially with regard to the scarcity of water resources, which can lead to enormous losses for humanity (Safonov 2020). The availability of water resources will be the major challenge to future societies and to the environment under climate change (FAO 2015; Huang and Tao 2020).

In the context of global warming, variations in the atmospheric system have accelerated temporal and spatial changes in the water cycle (Taylor et al. 2013), as well as intensifying the global and regional water shortages (Schewe et al. 2014). Climate change is characterized by rising temperatures and more common extreme events such as heatwaves, heavy rains, floods, sudden droughts, and persistent droughts who have become critical concerns for the scientific community, governments, and the public (IPCC 2014; Hao et al. 2018).

Furthermore, the vulnerability of water resources to the threats of climate change underscores the urgent need for action to mitigate and adapt to these impacts (Huang and Tao 2020). Under climate warming, the global terrestrial cryosphere has undergone changes involving glacier retreat, snow reduction, and permafrost degradation, all of which affect the water cycle (Ding et al. 2020). These impacts are in addition to those created by human activities (Vörösmarty and Dork 2000; Wang et al. 2010). Humans affect the water cycle through greenhouse gas emissions (Piao et al. 2007; IPCC 2014), as well as through water conservation projects and water consumption activities (Haddeland et al. 2014; Tang et al. 2015; Wada et al. 2017). Rapid population growth and increased consumption levels have put unprecedented pressure on the world's water resources (Dosdogru et al. 2020).

On the other hand, the lack of safe drinking water in quantity and quality is another problem to humanity. The growth of population density and industrialization have led to an increase in the type of contaminants in water bodies, a situation that puts public health at risk through inadequate sanitation and hygiene, which in turn causes diseases in human beings. The wastewater created in developing countries is discharged without any treatment, polluting surface waters and causing the transmission of waterborne diseases (UNESCO 2018). The physicochemical and microbiological contaminants in water bodies are contributing agents of diseases such as malnutrition, compromised immune system, physical growth and cognitive development, chronic

disability, and even death. Besides, health problems could be intensified in the future by the growth in the frequency and strength of tropical storms, floods, and droughts caused by climate change (Pichel et al. 2019).

The Organization for Economic Co-operation and Development (OECD) and the United Nations Environment Programme (UNEP) have highlighted the critical role water governance plays in sustainability issues (OECD 2015; United Nations 2020). The OECD (2015; Venzce et al. 1997) has introduced good governance practices to address water crises, as governance gaps hinder the design and implementation of technical and non-technical solutions identified in water policies. In the same line, water sustainability issues have been included in the UN 2030 Agenda and its 17 Sustainable Development Goals (SDGs), which provide a common framework for measuring sustainable development from a social, economic, and environmental perspective (Glass and Newig 2019; Woodhouse and Muller 2017).

In contemporary society, uncertainties and risks are dominant concerns in the business environment, as well as in the management of public assets. Increasing problems of water scarcity and drought clearly require a more sustainable approach to water resource management across the world. This need is, already, reflected in water-related policy and legislation. Economic activities in human-oriented systems inevitably result in freshwater consumption and wastewater discharge; they would exacerbate water scarcity problems through reducing the available amount of freshwater and deteriorating the quality of usable water (Chengyu et al. 2020).

Summary

Water is the driver of nature and its accessibility and quality often constitute a limit on economic development and human welfare. For this primacy, the mission of providing water in sufficient quantity and suitable quality to the world's human population while assuring its availability for

future needs constitutes one of the distinguished challenges of the twenty-first century (Tarhule 2017).

The most significant resource on the planet is water, no human or any other life could live without water. However, water resources are becoming progressively scarce. This scarcity, joined with the numerous competing uses for water, creates complex choices over how water resources must be allocated (Grafton et al. 2013; Zurita et al. 2015). Many regions in the world have been facing severe water scarcity problem due to economic development and urbanization (Feng et al. 2014; Liu et al. 2020). By 2050, urban surface-water deficit was projected to be 6.75 million tons, because of the imbalance between water supply and demand (Flörke et al. 2018).

All these problems are increasingly aggravated by climate change, which directly affects the hydrological cycle and consequently the quantity and quality of water resources. The water is a general interest feature, so implementing technologies and practices that either conserve water or use it more efficiently plays a key role in the demand-side approach to water management. It is critical to integrate the protection and sustainable management of water resources into other community policies to ensure their long-term health and viability. Water is a finite resource, and its availability and quality are essential for a wide range of human activities, from agriculture and industry to household use and recreation (Pichel et al. 2019).

Definition/Description

The issue of sustainability has received various treatments over the past two decades. A spectrum of perspectives has been identified ranging from a technocentric “very weak sustainability” position to an ecocentric “very strong sustainability” position (Gibbs et al. 1998). Weak sustainability (shallow environmentalism) emphasizes the idea of the quantitative side of growth (Balaceanu and Apostol 2014). Based on Robert M. Solow’s (1986, 1993) ideas, weak sustainability implies a constant amount of total capital assets (resources) over the time, while natural and produced (manmade, manufactured) capital is interchangeable (Turner 1993). Some resources may be reduced because of the increase of other ones (Neumayer 2003).

Following the definition proposed by Pearce and Atkinson (1993), an economy is considered sustainable if its savings rate is greater than the combined depreciation rate on natural and produced capital (Cabeza Gutiérrez 1996). Under this notion, sustainability is equivalent to non-decreasing total capital stock. This is referred to as “weak” sustainability since no restrictions on the degree of substitutability between natural and produced capital are introduced, and thus natural capital receives no special treatment. Consistent with this interpretation, Pearce and Atkinson (1993) presented a weak sustainability index as

an economic indicator of sustainable development. The weak sustainability index is defined as the difference between the savings rate and the sum of the depreciation rate of natural and produced capital. That is, an economy is considered to be “weakly” sustainable if and only if the weak sustainability index is greater than zero (Cabeza Gutiérrez 1996).

Introduction

Sustainability includes many dimensions related to ecology, society, economics, technology, and other system aspects (Cabeza Gutiérrez 1996; McMichael et al. 2003). The main idea is trying to satisfy the needs of the present without prejudicing the following generations’ capacity of equally satisfying their own needs (WCED 1987). Barr (2016) argues that the Brundtland definition has a technocentric perspective, and thus, it is an anthropocentric ideal (Manning 1990). A definition of sustainable development that many economists may accept is “development [that] does not decrease the capacity to provide non-declining per capita utility for infinity” (Neumayer 2003, p. 7). Based on the neoclassical logic, the concept of sustainable growth receives a quantitative understanding (Balaceanu and Apostol 2014). According to this approach, the concept of sustainability seeks the optimal extraction of nonrenewable natural resources. It also refers to the use of innovative technologies which have certainly increased the capacity of the environment and which should compensate the negative impact on the environment. Such sustainability also supports the free market, exploitation of resources, and growth focused on produced (manmade, manufactured) capital (Davies 2013).

The need to develop sustainability indicators is central when assessing whether an economy is sustainable or not. Within the field of economics, this search for an operational definition of sustainable development has led, among many other contributions, to the concepts of strong and weak sustainability (Cabeza Gutiérrez 1996). Strong sustainability regards natural capital as providing

Weak Sustainability, Table 1 Features of very weak and weak sustainability (Davies 2013; Gibbs et al. 1998; Pearce et al. 1994; O’Riordan 1996; Turner 1993, 2001; Williams and Millington 2004)

Perspectives	Technocentric (techno-optimistic); anthropocentric (human centered)	
Sustainability labels	Very weak (weaker): problems that arise will be solved by modifying existing structures through technological development	Weak: by changing some processes there will be less tangible problems dealt with
Green labels	Resource exploitative, growth-orientated position	Resource conservationist and “managerial” position
Ethics	Traditional ethical justification for the right of the present generation to use nature. Nature has instrumental value, and it is seen as a resource to which human beings have a right of dominion	Expanded ethical principles: taking care of others and the idea of intra- and intergenerational equity Instrumental value in nature
Type of Economy	Economic growth is a valid measure of “progress,” unfettered free market	Green economy and green markets guided by economic incentives

some functions that are not substitutable by produced capital. These functions, labeled “critical natural capital,” are stressed by defining sustainability as leaving the future generations a stock of natural capital not smaller than the one enjoyed by the present generation. That is, sustainability is viewed in terms of non-decreasing natural capital. Weak sustainability implies a constant amount of total capital assets (resources) over the time, while natural and produced (manmade, manufactured) capitals are interchangeable (Solow 1986, 1993). The strong and weak concepts outlined above can be considered to represent two opposing ends of sustainability. This article focuses on the second of these views (Table 1).

Key Issues

Weak sustainability is based on the work of two neoclassical economists: Solow (1986, 1993) and Hartwick (1977, 1978). It can be interpreted as the extension of economic welfare (Neumayer 2003) where tradeoffs are still possible (Gibbs et al. 1998; Turner 1993). Advocates of weak sustainability (Solow 1993) argue that a development path is sustainable if it provides constant or increasing level of utility or welfare to successive generations. Weak sustainability requires the maintenance of the total capital stock through time (Turner 1993). The total capital stock is composed of produced or reproducible capital, human capital, or the stock of knowledge and

skills, natural capital or exhaustible, and renewable resources, together with environmental structures, functions and services (Turner 2000). Weak sustainability is related to the precautionary principle or safe minimum standards. According to this principle, some natural capital is critical, that is, nonsubstitutable (Turner 1993). It limits, therefore, set on natural capital usage and see that it should be possible to substitute natural capital for produced capital (Gibbs et al. 1998). Weak sustainability favors green economy and green markets guided by economic incentives (Davies 2013). Green economy is an economy that results in improved human well-being and social equity while significantly reducing environmental risks and ecological scarcities (UNECE 2018).

In weak sustainability, ethical principles include taking care of others and the idea of intergenerational equity (Davies 2013). Unlike Pezzey (1992), Davies (2013) argues that weak sustainability includes also the idea of intragenerational equity. The Hartwick’s rule (Hartwick 1978) is used to buttress the weak sustainability position by regulating intergenerational capital bequests. The rule lays down that the rent obtained from the exploitation of the natural capital stock by the current generation should be reinvested in the form of reproducible capital which forms the future generations’ inheritance. This inheritance transfer should be at a sufficient level to guarantee non-declining real consumption (well-being) through time. In weak sustainability it is seen that by

changing some processes, there will be less tangible problems dealt with (Davies 2013). It also argues that one needs to expand the stock of resources. This can be done by developing renewable resources, creating substitutes for nonrenewable resources, making more effective use of existing resources, and/or by searching for technological solutions to problems such as resource depletion and pollution (Williams and Millington 2004).

Beside the term “weak sustainability,” it has been used the terms “very weak sustainability” (Turner 1993, 2001) or “weaker sustainability” (Williams and Millington 2004). Advocates of very weak sustainability see that nature has predominantly instrumental value (O’Riordan 1996) and support traditional ethical justification for the right of the present generation to use nature (Davies 2013). They also believe that economic growth is a valid measure of “progress” (Williams and Millington 2004) and that development should be based on unfettered free market (Davies 2013). Based on the idea of very weak sustainability, overall stock of capital assets remains stable over time, and complete substitution between human and natural capital is possible. There is a link between willingness to pay and sustainable development.

As weak sustainability, also very weak sustainability has a technocentric or techno-optimistic perspective (cf. Turner 1993). Technocentrists are optimistic about the extent of current and future substitution possibilities between different forms of capital (including environmental resources) (Pearce et al. 1994). At the heart is an optimistic belief that any problems that arise will be solved by modifying existing structures through technological development (Davies 2013). It is, therefore, thought that economic growth will probably not be overly constrained either by absolute or relative resource scarcities and that individual utility functions are smooth, signifying extensive substitution between human wants (Williams and Millington 2004).

Based on O’Riordan’s ideas (1996), it can be stated that both weak and very weak sustainability adopt anthropocentric (human-centered) ideal on the relationship between people and nature. The

main anthropocentric ideas are (1) people are separated from nature, (2) nature is a “resource” to be used for the benefit of society or individuals, and (3) people have the right to dominate, to control, and to manage nature for the benefit of people (Williams and Millington 2004). These kind of thoughts also support the free market (Davies 2013) which is based on the idea that as nonrenewable resources get scarce, their prices will rise and substitutes will be encouraged. The problem with this solution is that the resources that are most threatened are those without markets, for example, such as the receiving capacities of the oceans, atmosphere and stratosphere, and the greater part of the world’s biological diversity (Pearce et al. 1994).

Summary

The studies reveal the existence of two interpretations of the environment, namely, from an environmental perspective and from a perspective of an economic development, reflecting different positions. A spectrum of perspectives can be identified ranging from a technocentric “very weak sustainability” position to an ecocentric “very strong sustainability” position. Weak sustainability positions assume that there is a very high degree of substitutability between human capital and natural one. Strong versions of sustainability emphasize the assumption of almost infinite substitutability of resources. Under weak versions of sustainability, the market and the preservation of the status quo play a much greater role than in strong versions.

Weak sustainability stresses the adjustment of existing activities within existing operational boundaries. It represents resource conservationism and “managerial” position. It requires the maintenance of the total capital stock through time by regulating intergenerational capital bequests and expanding the stock of resources, e.g., by developing renewable resources, creating substitutes for nonrenewable resources, making more effective use of existing resources, and/or by searching for technological solutions to problems such as resource

depletion and pollution. So, by changing some processes there will be less tangible problems dealt with. What concerns on ethical principles, weak sustainability stresses the idea of instrumental value in nature and intergenerational equity. According to some researchers, also intragenerational equity is covered by the core ethic of weak sustainability. Green economy and green markets guided by economic incentives are supported by advocates of weak sustainability.

Very week (weaker) sustainability sees that problems that arise will be solved by modifying existing structures through technological development. It stresses that resources are exploitative, and thus, it has growth-orientated position. Traditional ethical justification for the right of the present generation to use nature is supported. So, nature has instrumental value, and it is seen as a resource to which human beings have a right of dominion. The advocates of very weak sustainability think that economic growth is a valid measure of “progress” and they emphasize unfettered free market.

Very week and weak sustainability are seen to employ a technocentric and an anthropocentric perspective. The core idea of the technocentric perspective is that any problems that arise will be solved through technological development. In the anthropocentric perspective, it is seen that nature is predominantly a resource to which people have a right to dominate. The difference between the concepts of very weak and week sustainability lies in how nature is used and how much use of nature is allowed to satisfy human needs.

Definition

According to Collins Dictionary (n.d.), “whistleblowing is the act of telling the authorities or the public that the organization you are working for is doing something immoral or illegal.” The act is called whistleblowing, and the person doing this is called a whistleblower. The definition is simple and does not present the context in which someone decides to go public. Scaturro (2018, p. 2) highlights that there is no “unanimous legal definition” of the term, this being sometimes presented differently by “academics, international and regional organizations.” According to Transparency International (n.d.), whistleblowing means disclosing “neglect or abuses within an organization . . . that threaten public interest.” In these conditions, there appeared the need to have protection laws for whistleblowers that suffer the consequences for revealing acts of corruption or other immoral or illegal acts in the companies or

institutions where they work. Jubb (1999, p. 77) mentions the long history of the term (more than 50 years before he wrote the article) and considers that there are numerous and unfortunate situations in which whistleblowers are misjudged as corrupt informers. Still, whistleblowers are at the opposite pole; they are driven by integrity when disclosing the wrongdoing in an organization.

Introduction

In order to have a better picture of the whistleblowing phenomenon, we have to understand the term from different perspectives: Who are the whistleblowers? What are their motives? Which are the conditions required by an action to be considered as whistleblowing? In a simplistic way, the motives behind the whistleblowing can be related to morality or to the personal interests of whistleblowers. Ideally, whistleblowing should be driven by the honesty and morality of an individual, but in many cases, it is also related with other interests.

Baltaci and Balci (2017, p. 39) consider that there are individual (protection or individual gains that can be material or spiritual), organizational (to achieve a better position in the organization, to “punish” the organization for its behavior), and social reasons (having in mind the public interest and the well-being of the society) for becoming a whistleblower.

Considering these reasons, a company should understand the importance of protecting whistleblowers and offering them a proper background in which the employees feel safe to disclose the wrongdoing. According to Stuben and Welch (2020), the whistleblowing is beneficial for the company on the long term, the authors showing that the internal whistleblowing “is associated with fewer and lower amounts of government fines and material lawsuits.” Even if the company’s image will suffer after the disclosure, this is the right path to follow. A strong management with clear strategies of communication will succeed to recover from this. A reference to the benefits of whistleblowing for a company is made by Yeh (2011) who mentions a whistleblowing

policy that requires the employees to first disclose the wrongdoing internally and only afterward externally. This policy not only reduces the damage on the reputation of the organization, but also maintains a good relationship among employees and employers.

Latan, Jabbour, and de Sousa Jabbour (2019) present the triangle of whistleblowing, analyzing the relationship between the intentions of whistleblowers to disclose the wrongdoing and factors such as opportunity (having the appropriate channels for reporting anonymously), rationalization, and financial incentives (being rewarded for disclosing the wrongdoing). The authors mention that their empirical research is conducted in the Indonesian context in which whistleblowers are not encouraged to report wrongdoing and do not feel protected and that their study is focused on auditors. Sørensen, Gaup, and Magnussen (2020) also refer to the motivation factors that can increase the willingness of employees in revealing corruption in their organization. The study focused on the Norwegian municipalities revealed that the most important factors are recognition from their supervisors and having more accessible and safe channels for reporting wrongdoing.

Oran and Ünsar (2020) highlight that whistleblowing is strongly influenced by the leadership style. Thus, a manager that is more open and adopts an ethical behavior encourages employees to speak up and report illegal activities or behaviors in the organization. Seeler, Fuchs, Stöckl, and Sixl-Daniell (2019, p. 219) appreciate that “strict governance processes are strong facilitators for effective whistleblowing.” The authors consider that whistleblowing is part of the organizational culture and is also influenced by it.

Ethics management is a part of the management in which ethics is incorporated in the organizational climate using different tools. One of these is having precise whistleblowing procedures and training the employees to know how to react when they are faced with ethical dilemmas. Besides these procedures, a company should have other tools: a code of conduct or an ethical code that should be disseminated to all employees, an ethical committee for preventing

the wrongdoing, ethical trainings for preparing the employees to deal with ethical problems and dilemmas, a dedicated ethical hotline for whistleblowers to make them feel safe from retaliation, and an ethical audit for evaluating the ethical climate in an organization. All these should prevent the wrongdoing, but if there are ethical problems in a company and an employee finds out or is a witness of those problems, whistleblowing should be encouraged in order to put an end to illegal or immoral activities in a company for the well-being of everyone involved (employees, community, public authorities, and the company itself).

Whistleblowing Classification

Miceli and Near (1992, p. 31) mention three elements that are useful in establishing whether a behavior is considered whistleblowing and of which type. These are: “employee concerns,” “political behavior,” and “prosocial behavior and organizational citizenship.” According to the authors, disclosing a behavior that is immoral or illegal is considered whistleblowing when the whistleblower stays in the organization and decides to speak up against it and can be internal (when disclosing the wrongdoing to someone inside the company who can take the appropriate measures) or external (when disclosing the wrongdoing to someone outside the company).

The two types of whistleblowing (internal and external) could occur separately but also in the same case. For example, when a whistleblower discloses the wrongdoing internally but there is no solution provided and the wrongdoing continues, he or she can address the problem publicly becoming an external whistleblower. Johnson (2003, p. 4) considers whistleblowing only as external appreciating that the whistleblower should go “to parties outside the organization,” this being one of the conditions for an act to be considered as whistleblowing. On the contrary, De George (1986) appreciates that the whistleblowing is moral only when the whistleblowers first disclose the bad behavior in

the organization to a supervisor or to someone inside the entity.

There are differences regarding the phenomenon of whistleblowing, its definition, or classification. Some countries use different terms, some having a bad connotation as the meaning attached to this behavior. According to Transparency International (2013), there are “positive, negative, neutral or none” connotations to the term *whistleblower* in the EU countries.

Sometimes, whistleblowing is seen as a political behavior (Miceli and Near 1992) because of the motives and personal interests that stay behind whistleblowers’ actions. Not always, even if ideally it would be desirable to be driven only by altruistic reasons, whistleblowers aim the public interest of the community. In some cases, they have their own agenda. So, even if the consequences are good and they contribute to saving the situation from the illegal or immoral activities in an organization, the motives are not always pure. This reminds of the Kantian and utilitarianism theories that classify an act as being bad or wrong considering the motives (in Kantianism, bad intentions mean that the act is wrong) and the results of an act (in utilitarianism, if the result is good for the public, it does not matter which were the intentions).

According to Nan (2017), there are four types of whistleblowing: internal and external according to the recipient of the disclosure, and open and anonymous if the identity of the whistleblower is revealed or not during the process. The author also addresses the problems of the internal conflicts faced by the whistleblowers in terms of loyalty (to the company, the public, and the profession). We could also add the loyalty to someone’s moral compass.

Whistleblowers’ Protection

Transparency International (2013) published a report about whistleblowing in Europe, and the laws meant to protect whistleblowers from retaliation after disclosing the wrongdoing. These laws are not only for protection but also for encouraging whistleblowers to speak up about the illegal or

immoral problems they are aware of in the companies or institutions where they work. Transparency International appreciates that there are three classes of protection laws in EU countries: advanced legislation for “providing comprehensive” procedures that protect whistleblowers (in Luxembourg, Romania, Slovenia, and UK), “partial provisions” (in Austria, Belgium, Cyprus, Denmark, Estonia, Czech Republic, France, Germany, Hungary, Ireland, Italy, Latvia, Malta, Netherlands, Poland, and Sweden), and “none or very limited” procedures (in Bulgaria, Finland, Greece, Lithuania, Portugal, Slovakia, and Spain).

Loyens and Vandekerckhove (2018) analyze the legal framework for whistleblowing from an international perspective and conclude that some countries have separate legislation for public and private sectors (Australia, South Korea, USA, and Israel), others only for public sector such as in Belgium (we can find this country under the “partial provisions” class in Transparency International’s report from 2013), and others that address both sectors in the same legislation (Ireland, France, Norway, UK, Serbia, and the Netherlands). We notice that most of the latter are in the “partial provisions” class (if we refer strictly to the EU countries) with one exception – UK that has a comprehensive legislation according to Transparency International.

Having a comprehensive law does not always translate into an exceptional application of it. The laws create the premises, but these should be communicated to the employees, helping them to understand that they are protected if they become whistleblowers. Puiu and Barbu (2015) present the situation of Romania, a country with a comprehensive legislation but with few people knowing about the law that exists since 2004 (Law no. 571/2004). Gamberini (2013) presents some cases of whistleblowing from Germany and Italy where the whistleblowers found justice after more than 6 years. All these cases show that having a good law is not enough for protecting whistleblowers. The most important factor in protecting them is disseminate the laws among the citizens and create the background for them to act and use the law in their favor.

Importance of Whistleblowing

The benefits brought by whistleblowing consist in having a more trustworthy climate in organizations. If the whistleblowers are not afraid to speak up, this is finally translated into a cleaner community. On the short term, organizations may suffer a damage to their image, but on the long term, they will benefit from having a more ethical climate. The advantages brought by whistleblowing are highlighted by Makhija and Kulshrestha (2018): shareholders’ trust in the company, greater transparency, protection for all actors involved, and diminished potential risks in the future. The authors also present the downsides of whistleblowing, but all of them refer to downsides for whistleblowers not for the company.

It is difficult to eradicate corruption or all immoral/illegal activities, but a company’s management can apply some measures to reduce them and diminish the bad consequences on its image: implementing various tools from ethics management at the organizational level (ethical codes, committees, audits, trainings, ethical hotlines, and whistleblowing procedures), communicating them to the employees and the management, creating a safe environment for the whistleblowers where they will not be afraid of retaliation and will be encouraged to speak up (anonymous hotlines, mail boxes), making the process easy and simple, applying the whistleblowers’ protection law of the country if there is one, and training the employees on aspects related to corruption and other ethical dilemmas.

Summary

Despite the fact that there are different terms used for the meaning of whistleblowing and various connotations in different countries, this phenomenon refers to a disclosure of illegal, harmful activities that affect the public interest in an organization. This revealing can be internal or external, companies preferring the former one because it gives them a higher control in order to reduce the negative image encountered if the problem

would be made public. Taking into account that employees are afraid of retaliation and they are not encouraged to speak up, there were implemented laws for their protection in Europe. These ensure that whistleblowers are protected if they disclose wrongdoing, thus contributing to a cleaner environment in companies. Procedures and policies on whistleblowers' protection were implemented in organizations as a part of their ethics management and together with other tools such as ethics codes, committees, audits, ethical trainings, and ethical hotlines provide a more ethical culture in companies. Whistleblowing is important bringing benefits on the long term. Companies that encourage whistleblowers to disclose the harmful activities have a better image and reputation in the long run than those who try to cover these problems and protect their reputation on a short term.

Synonyms

Deep Throat; Informant/Informer; Insider; Making a disclosure; Snitch; Source; Whistleblower; Whistleblowing

Definition

According to the UNCAC (2004), a whistleblower is “any person who reports in good faith and on reasonable grounds to the competent authorities, any facts concerning offences established in accordance with this Convention.” The convention itself establishes various corruption-related offences.

In other words, a whistleblower is someone who reports misconduct in any of the 5 economic sectors, namely, primary, secondary, tertiary, quaternary, and quinary sectors, so as to facilitate corrective action from the requisite authorities. Such a whistleblower is usually a stakeholder of a given organization, that is, he/she could be a (former) employee, or a supplier or any such person who may have or have had access to or inside knowledge on alleged misconduct. The said misconduct is usually in the realm of violating rules and regulations, fraud, abuse of rights, corruption, health and safety violations, sexual harassment, among many others.

According to Collins Dictionary (n.d.), whistleblowing is defined as “the act of telling the authorities or the public that the organization you are working for is doing something immoral or illegal.” The International Labour Organization (ILO) defines whistleblowing as “the reporting by employees or former employees of illegal, irregular, dangerous or unethical practices by employers” (ILO Thesaurus n.d.).

In other words, therefore, the process or act of reporting to authorities or bringing into public

domain incriminating information on any given entity on perceived ills is called whistleblowing. The person or persons who blow the whistle on a company’s misdeeds are called whistleblowers.

Famous Whistleblowers

Li Wenliang – Wuhan Central Hospital (Green 2020)

Thomas le Bonniec – Apple (Hern 2020)

Christopher Wylie; Cambridge Analytica (Gross 2019)

Edward Snowden – NSA (“Edward Snowden: Leaks that exposed” 2014)

Chelsea Manning – US Army (“Chelsea Manning” 2017)

Sherron Watkins – Enron (Lacayo and Ripley 2002)

Coleen Rowley – FBI (Lacayo and Ripley 2002)

Cynthia Cooper – Worldcom (Lacayo and Ripley 2002)

Karen Silkwood – Kerr-McGee (Rashke 2000)

Jefferey Wigand – Brown & Williamson (Brenner 1996)

Background

Whistleblowing has a very philosophical side based on morality and ethics, in that it evokes issues of trust and loyalty. An employee working for an organization is privy to inside information. The employee is in most cases expected to treat this information with confidentiality. However, when the said employee feels that the acts of the organization are questionable, damaging, destructive, or harmful, then the loyalty the employee feels towards the organization and likewise the trust the organization placed in the employee both come into question. The employee now must choose between reporting such misconduct or carry on with business as usual. This places severe burden on the employee’s shoulder and very often creates serious conflicts not only the professional but also on the personal level. The issue of responsibility to report and loyalty to the organization therefore often

creates grounds for animosity on both the sides. This has in the past turned rather aggressive with serious consequences for both the whistleblower and at times the organization as well.

The employee(s), in general, should be able to voice their concerns to appropriate authorities within the organization, safely. When the internal mechanisms, to safely address the issue(s) fail, employees turn towards other outlets, like, for instance, presenting evidence to the media, or to relevant authorities.

It is well accepted, in principle, that it should not be possible to sweep embarrassing or potentially damaging truths of organizations or governments under the rug. These truths should have the right to be in the open, more so, if these negatively affect the unsuspecting public at large. Having said that, organizations and the governments of countries are relatively powerful entities. They can – under the guise of confidentiality, competitive strategy, or national security – continue persecuting the whistleblower while conducting their businesses in a debatable fashion. For example, it is no secret now, thanks to whistleblowing, that organizations and governments alike around the world have been collecting personal information on unsuspecting public, without their explicit permission.

Many such high profile whistleblowing cases often have polarizing effects, for instance, Mr. Edward Snowden who blew the whistle on the global mass surveillance system of the US Government is a traitor to some and a hero to others (“Was Snowden hero” 2017).

The consequences of whistleblowing can be dire for the whistleblower, and it can also cause severe and at times debilitating economic issues on the company front.

Regulations to Protect Whistleblowers

Whistleblowing has the potential of severely disrupting the (internal/external) functioning of the accused entity. Quite often it results in the businesses being dismantled with responsible personnel facing judiciary action. Since the consequences can be quite dramatic, whistleblowers

need to be very sure about their claims and accusations and need to have solid proof to substantiate such claims and accusations.

Most companies have a so-called “confidentiality agreement” colloquially referred to as a gag order in place to prevent sensitive information from being leaked out. Confidentiality agreements are a common place in the working world, with most employees having to sign contracts that include clauses on some form of confidentiality. When such contracts are breached, it leads to different forms of repercussions. The most common is being losing the job for the said employee. On the other hand, slighted or disgruntled employees or commensurate stakeholders may seek to act out vindictively against an organization. In such cases, it becomes apparent that the parties involved need to have some form of legal redressal.

The very first official whistleblowing act is often credited to the ten marines and soldiers on board the American Warship Warren in 1977. They were (rightfully) concerned about the questionable behavior of the commander of the Continental Navy, namely, Commodore Esek Hopkins. America’s very first whistle-blower protection law resulted from this event (Kohn 2011).

Today whistleblowing and whistleblower protection is usually a part of CSR of an organization and companies most often have a policy on facilitating safe whistleblowing. While this may vary across countries, many consider such facilitation of paramount importance. This is because, in many ways, it promises ethical conduct of organizations.

Many statutory rules have been put in place to promote safe whistle blowing around the world. These allow for anonymous whistle blowing, setting up of clear reporting channels and processes, establishing criminal penalties for those who persecute legitimate whistleblowers, and training personnel to handle the different aspects of whistleblowing, among others.

The European Council of the European Union (2019), in its press release, stated that new EU wide rules that increase the protection for stakeholders would come into force in year 2021. They promised “high level protection to whistleblowers” in various sectors. This is highly

pertinent since the EU legislation, in this context, is currently limited mostly to financial services.

Context of CSR

Despite there being various legislative protections in place, with more to come, whistleblowing still remains a dangerous decision to make for anyone. Consistently, history has shown that despite there being safety measures in place, whistleblowers face discriminatory retaliation. As quoted in the *Time Magazine*, Coleen Rowley (2002) of FBI said “The credibility of the investigation I helped launch into pre-9/11 lapses at the FBI was undercut by suspicions that I was motivated by the fame that came along with being on the cover of *TIME*. Still, the publicity is what kept me from being fired from the FBI.”

Since the company has much to lose lest its misconduct is made public, very often companies and governments retaliate harshly. In Jeffery Wigand’s case, he not only lost his job but was also labeled a shop lifter, liar, abusive partner among a few other choice labels. Chelsea Manning suffered in prison and Edward Snowden is still in asylum in Russia at the time of writing this definition.

There are many reasons the organizations retaliate in such fashion, among which simple economics is always an important contender closely followed by reputation. In case of governments, this is taken to another level. Quite often with the governments, whistleblowing has bordered on possible espionage or spying given the (usually) sensitive nature of the information.

Despite there being measures in place to protect whistleblowers from retaliation, there is increasing evidence that these measures are just ineffective. Dworkin (2007) states that in the USA, despite the Sarbanes Oxley (SOX) Act having 2 clear provisions to address the issue of whistleblowing, it is simply illusory. This is because the persecuted whistleblowers have been consistently unsuccessful in getting redressal.

To summarize, among others, focusing on consistent growth and increasing shareholder

value often leads companies to take borderline (un) ethical decisions. Being caught in such situations could trigger justified whistleblowing on the company, its personnel, and/or its activities. Whistle blowing can be expensive. To ensure long-term sustainable performance of the company, it is very important to have measures in place that inhibit unethical behavior at the very core. Thereafter, providing proper channels for safe whistleblowing where the whistle blowers are protected from criminal or other form of retaliation should become standard. Persecution in any shape or form of the whistleblowers should have serious consequences for all concerned. The revamp of the whistleblower protection laws in the EU is therefore a right step in that direction.

William C. Frederick

Knut Kipper

Witten/Herdecke University (UW/H), Witten, Germany

Basic Biographical Information

William C. (Bill) Frederick (4 May 1925 in Mena, Arkansas – 16 March 2018 in Pittsburgh, Pennsylvania), Professor Emeritus, Katz Graduate School of Business, University of Pittsburgh, was among the founders of the study of Corporate Social Responsibility (CSR) and inspired several generations of business ethics, CSR, management and sustainability scholars, and professionals globally. The World War II was Frederick's self-proclaimed "escape" from his native Arkansas and opened up the world to him. To this author's happy Veteran's Day wishes Frederick replied back in 2014 that:

I never really feel like a "war veteran" in spite of serving during WWII, but I do fondly remember my father who served in Europe during WWI. Let's see, that was to be "the war to end all wars," wasn't it? It's what you do after the war that counts the most, I believe. (Personal communication, November 11, 2014)

Frederick enjoyed the intellectual debate about his field but unlike many scholars was always able to consider a much larger context, considering everything relating to culture, society, social and economic issues, politics, and nature.

After serving in Belgium during World War II, Frederick earned his B.A. and Ph.D. in economics and anthropology at the University of Texas-Austin. He taught at Tampa University, the University of Florida, and Kansas State University, where he was also dean of the business school, before coming to the University of Pittsburgh's

Katz Graduate School of Business as Associate Dean, Dean, and finally as Professor of Business Administration, focusing on corporate social responsibility, business ethics and values, and evolutionary interpretations of business behavior. During our monthly lunches at Panera Bread across from Maybe Magee-Womens Hospital in Pittsburgh Frederick often and proudly mentioned his Virginia lineage: his mother's family, the Crittendens, traced their ancestry to the Washington and Jefferson families – and his upbringing in a very pro-political environment and fond memories of Franklin D. Roosevelt (personal communication, 05.2005–06.2015).

Major Contributions

Substance of the Frederick Contributions

As early as in the 1960s Frederick put his focus on studying and writing about corporate social responsibility (CSR) and must be considered one of the founding fathers of the developing academic field:

During the 1970s, Frederick continued advancing the newly founded CSR field. He described the stages and conceptualizations of CSR ranging from CSR1, a pre-conventional moral reasoning stage focused on corporate social responsibility as it relates to the self-interest of the company, to CSR4, representing a more post-conventional moral reasoning akin to consciousness. CSR2 eased into corporate social responsiveness, which meant CSR2 is a more pragmatic approach influenced through the realization that a company's relationship with society is an essential asset. The moral reasoning behind CSR2 can be found between pre-conventional and conventional. Corporate social rectitude can be found within the paradigm of CSR3. CSR3 takes a view between conventional and post-conventional reasoning building on the assertion that “embedded within humankind are moral meanings and conceptions of what is felt to be ethical” (Frederick 1986, p. 134). In Frederick's publication *Moving to CSR4: What to Pack for the Trip* from 1998 in *Business and Society*, he shifted his focus to developing the concept of CSR4,

which he thought needed a broader and deeper interest in space, science, and religion, an almost metaphysical approach. Frederick was aware that his ideas might not be recognized from the contemporary CSR community, which often lacks the intellectual ability to go beyond the boundaries of our own research. *Business & Society*, which Frederick published and updated between 1980 until 1996, influenced generations of business students (Carroll 2018).

Arguably, his most impactful later works consist of *Corporation, Be Good! The Story of Corporate Social Responsibility* (Frederick 2006), in which he presents the history and definition and an outlook on where the developments will lead in the area of corporate social responsibility.

Told in an eyewitness, I-was-there style by a pioneer of the study of CSR in the nation's business Schools, it takes the reader through a half century of corporate scandals and fierce struggles over corporate ethics—from Ralph Nader's 1960s Campaign GM to today's white collar crimes at Enron, WorldCom, Tyco, and other Wall Street giants. It lays bare the values that drive corporate culture, explores the motivational depths of corporate strategy and policy, demonstrates how biological impulses can lead business decision makers astray, questions the relevance and ethical commitment of business school education, reveals the spiritual side of management life, and holds out hope that the New Millennium will see improvement in the ethical performance of business. (Frederick 2006)

In *Values, Nature, and Culture in the American Corporation* (Frederick 1995), Frederick's undertaking was to explain the values that drive business. A particular focus falls on those values that are defined as individualistic and self-focused and unlike many business ethicists Frederick recognizes that these psychological traits are extremely opposed to the fabric of a fair and just society.

In his book *Values, Nature, and Culture in the American Corporation* (1995), Frederick investigates issues of essential importance to all those who wish to conduct business more ethically. In this work, Frederick introduced a new theory of the origin and role of business values, combining and synthesizing input from the natural sciences, social sciences, and the field of philosophy. At times one gets the impression that Frederick is an anthropologist, dissecting business through

the scientific study of humanity concerned with human behavior, human biology, and present and past cultures and societies, connecting the bigger picture in this works. Contemporary value systems that drive modern business enterprises and corporate managers can be traced back to the ancient natural evolutionary process as depicted by Frederick. He first examines the three value systems, which he finds to be incompatible, and therefore in a constant state of tension. The three value systems are divided into manager needs to efficiently allocate resources and achieve economic objectives, manager pursuits of the accumulation of power and influence, and the third value cluster focused outside of the corporation on community and stakeholder networks.

Frederick's central theory in *Values, Nature, and Culture in the American Corporation* (1995) offers two proposals to the business ethics crisis. One of the solutions is the reconciliation of businesses economizing practices with the community's needs for ecological congruence and balance. Frederick's critique of traditional business ethics theory offered in the book, and his proposal for a new normative synthesis of insights from natural science, social science, and philosophy, is among the most holistic approaches in the entire field.

Frederick's academic service, his dedication toward students as well as his service in the community of Pittsburgh were duly noticed and followed by several excellence awards.

Frederick led the Society for Business Ethics as well as the Society for Advancement of Socio-Economics as president and chaired the Social Issues in Management division in the Academy of Management. Internationally, Frederick conducted research in the field of management education in Spain, Italy, Egypt, former Yugoslavia, Ecuador, Nigeria, and Australia. Undoubtedly, Frederick the scholar and the person never stopped working after retirement. He maintained monthly meetings with young Ph.D. students, worked on his own scholarship, authored books and articles, chapters, entries to dictionaries and encyclopedias as well as enjoyed the time allotted

with his wonderful partner of 43 years, Dr. Mildred (Millie) S. Myers, well into official retirement. During the mature decades of his career, Frederick did not suffer from intellectual foreclosure. Rather he continued studying, contributing, and broadening his interests in the field of business and society, far beyond the usual academic boundaries.

Last but not least to mention are Frederick's Ph.D. students that he often referred to as his children: Albert Borelli; Rogene Buchholz; Denis Collins; Robert Hogner; Nancy Kurland; Harry Leonardi; Cliff Montgomery; Lyman Reed; Diane Swanson; William Tiga Tita; Robert Toy; David Wasieleski; James Weber; Richard Wokutch, and Donald Wygal.

Win-Win Situation

Katia Giusepponi

Department of Education, Cultural Heritage and Tourism, University of Macerata, Macerata, Italy

Synonyms

[Win-win game](#); [Win-win negotiation](#); [Win-win transaction](#)

Definition

In a win-win situation, all participants obtain a benefit. Based on the collaborative interactions among two or more players, this context includes no losers but only winners who gain an advantage. Competition, antagonism, and conflicting positions between participants are avoided, and mutual trust among actors is pursued in order to maximize the overall advantage.

The reference approach is that of game theory which allows the study of interrelationships between multiple wary subjects and the understanding of the individual and collective advantage and risk of choosing collaborative opportunity when possible (Von Neumann 1928; Von Neumann and Morgenstern 1944).

To adopt this alternative and pursue the win-win strategy, each player has to not give in to the temptation to compete with others and win a game that would collectively be zero sum (win-lose perspective), however with the risk of an overall

negative outcome (lose-lose situation) because the other actors could yield to the same temptation and follow the same individualistic path too.

Moreover, also collaborative choice causes risks for the player because, if betrayed by the others, it generates a lose-win outcome and thus the worst individual scenario.

Win-win Approach in Sustainability

The prisoner's dilemma, within game theory, is a well-known example that allows us to effectively highlight how, in the interactions between players, mutual suspicion and individualistic interest lead to not maximizing collective and individual outcomes.

In reality, the extent of opportunistic behavior may encounter some mitigating factors: in reiterated relationships, for example, each player's strategy also depends on the experience of previous interactions with the other party and will influence the other player's future behavior. According to Axelrod (1980, p. 3), "there are subtle reasons why an individualistic pragmatist can cooperate until the other party, somehow forgives, and be optimistic about the other party's responsiveness."

Moreover, there may be interventions by the institutions to encourage collaborative approaches.

The win-win perspective can also be applied to the different spheres – economic, ecological, and social – of sustainability, as parts to be considered in connection and between which ensure collaboration, in order to create synergies and increase the overall results of a certain organization. In this dimension, the terminology 'win-win-win' is widespread and precisely referred to the three indicated spheres.

The basic idea is that an organization can build foundations for prosperity only by effectively relating with all sustainability fields.

In particular, it can maintain a long-term overall balance only by considering all three kinds of issues in its strategies and decision-making, in order to enhance – in an integrated way and within a virtuous circle of interconnected effects – its overall contribution to the economy, society, and

environment, as well as to the quality of its connections with stakeholders.

This approach is opposed to the trade-off one, which is instead focused on the observation of conflicts between the different sustainability areas. These conflicts lead, in any specific situation, to identify priorities and to proceed with compromises within win-lose schemes.

In the win-win framework, the attention is addressed toward coordinating and aligning the economic, environmental, and social dimensions of the objectives. The hypothesis is that advances in one sphere positively impact on the other spheres and vice versa in a reciprocal relationship (Van der Byl and Slawinski 2015, p. 58).

Elkington has focused extensively on the need for companies to face the important challenge of collaborating in the field of sustainability – with customers, suppliers, competitors and all their other stakeholders – aiming to take advantage not only in the sense of "corporate citizenship" but also within a competitive dimension (1994, p. 99). This requires composing the different perspectives as a whole and optimizing choices and efforts within several directions.

In 1995, Porter and van der Linde have effectively underlined how innovation is a fundamental lever to identifying solutions which enable the enhancement of both environmental profiles and industrial competitiveness and how the two dimensions are inextricably linked (Porter and van der Linde 1995a, b).

Furthermore, Porter and Kramer (2006) have strongly underlined the importance of reference to shared value (significant for society and also positively impacting on the business) in powerful interconnection between competitive advantage and social responsibility.

According to these authors, the concept of shared value widens the extent of benefit creation and allows for the overcoming of the perspective based on trade-off needs in choosing between business and society (Porter and Kramer 2011).

Many studies have indeed identified a positive relationship between corporate social responsibility and financial results.

For instance, based on relevant meta-analysis, Orlitzky, Schmidt, and Rynes have highlighted

the positive correlation of the corporate social performance with corporate financial performance and that this “relationship tends to be bidirectional and simultaneous” (2003, p. 427); Albertini, focusing on environmental issues, has particularly underlined a link between corporate environmental management and financial performance, “supporting the win-win hypothesis” (2013, p. 443).

A Holistic Perspective

However, considering all the interactions – between the economic, social, and ecological areas of sustainability and between different elements within each of these specific areas – is not easy, and, even despite a win-win intention, actual trade-off situations could be created between spheres or within a specific sphere. Each of these pillars is immensely large and complex, and, in practice, supporting win-win strategies is hugely demanding. This aspect is emphasized by many, for instance, by Pope, Annandale, and Morrison-Saunders who have claimed: “the practical difficulty of integrating environmental, social and economic considerations in a way that fully recognises interactions and interlinkages, and that maximises ‘win – win – wins’ and minimises trade-offs was acknowledged” (2004, p. 613).

Moreover, many have argued that in reality – considering the profound complexity of sustainability issues and challenges – the conflicts, win-lose situations, and compromises are much more usual than the opportunities to compose profiles toward win-win solutions. In particular, according to Hahn et al. (2010, p. 217), they “are the rule rather than the exception.”

Indeed, tensions both between sustainability areas and between different profiles of the same sphere can be observed. It is thus necessary to approach sustainability based on an inclusive perspective that enables us to extensively consider these tensions, overcoming risks of partiality. In the win-win approach, there is a risk of exclusive focus on issues for which the alignment between areas or within the same sphere is more immediate, easy, and accessible (Van der Byl and

Slawinski 2015). An integrated and holistic approach allows us to avoid neglecting relevant tensions and to face sustainability issues in all their complexity.

Work-Life Balance

Dirk Reiser
Rhine-Waal University of Applied Sciences,
Kleve, Germany

Synonyms

[Compatibility of work and family](#); [Compatibility of work and private life](#); [Life domain balance](#); [Life satisfaction](#); [Quality of life](#); [Work life management](#); [Work-family conflict](#); [Work-life budget](#)

Description and Definition

It has become obvious that “work time practices are now more unpredictable, irregular and unsocial for employees in lower level jobs,” while pressure to work longer hours and more intensively has become more prevalent in managerial, technical, and professional jobs (Walsh [2019](#),

p. 398). Yet, in today's working environment, it is important to keep employees motivated, less stressed, and productive. This can be achieved by making employees feel valued, giving them a greater responsibility and a sense of ownership or by giving them greater control of their working lives (Byrne 2005). However, in order to achieve a more satisfied workforce that is more productive, less absent from work and happy to work for a particular company, issues regarding the work conditions in modern society have to be considered.

A particular problem of modern society in this regard is the lack of differentiation between work and private life, asking for work–life integration to create a “healthy” work–life balance. This development is driven by globalization (e.g., outsourcing, short-term contracts), demographic change (e.g., less young people in developed world, less potential employees in employable age), value change (e.g., pluralization and individualization, higher flexibility regarding job planning, importance of work–life balance), structural change (e.g., fourth industrial revolution with a transition from a service society to a knowledge society), and digital integration (e.g., blurring of home and work environments) linked with permanent availability (Kaiser and Ringlstetter 2010). Additionally, the COVID-19 pandemic has dramatically blurred the relationship of both spheres further. Consequently, the term work–life balance enjoys a high popularity for companies, the public, and science as it relates to the relationship of work and leisure and the compatibility of job and family. It is a term used in human resource management, organizational behavior, and quality of life studies.

The dynamic concepts developed out of the need to balance between all the individual commitments of private and working life linked to time management (Hoffmann 2019). However, there is no accepted definition of the term. Different viewpoints include, for example, a subjective or objective approach, a focal point on individual or organizational well-being, and a long-term or a short-term view (Papmeyer 2018).

Even so, it seems to be agreed that a modern work–life equilibrium needs to balance individual

time with individual energy (Kumanu 2020). Human beings who have an imbalanced life in regard to time, commitment to work, friends, family, and sport have to accept the possibility of illnesses (Hesse/Schrader 2017), higher stress levels, decreased job satisfaction, and productivity (Kumanu 2020). Accordingly, achieving a work–life balance is an individual and dynamic process that cannot be standardized, but is facilitated by tools to evaluate priorities regarding time commitments to assess work–life balance. Raja and Stein (2014) therefore add the term work–life budget to the discussion on work–life balance to evaluate how the individual optimizes her/his time by identifying how time is actually spent, to set goals as long-term objectives and to track the results against the set objectives with the ultimate goal being to enhance the quality of life. Sirgy and Lee (2018) provide a summary of the key characteristics and conceptualization of work–life definitions, focusing firstly on engagement in work life and non-work life and secondly on minimal conflict between social roles in work and non-work life (Table 1).

History

One of the earliest statements regarding the importance of a work–life balance is by John Ruskin, a social reformer. He wrote in 1851 that people would need three things to be happy at work: “they must be fit for it, they must not do too much of it, and they must have a sense of success in it” (Ruskin 1851, p. 7). First attempts to limit the time spent at work to find a balance between work and leisure go back to manufacturing laws in the late 1800s (Raja and Stein 2014). In these later stages of the Industrial Revolution labor reformers drew attention to employees (including children) and their issues. In the UK, for example, employees suffered negative social and health consequences as they commonly worked 14–16 h for 6 days a week. This was also not uncommon in other European countries and the USA. Consequently, later reforms, such as the 40 h work a week, were introduced in the USA (1940) and Germany (1918) (Kumanu 2020).

Work–Life Balance, Table 1 Various conceptualizations of work–life balance

Theoretical approaches to work life balance	Key characteristics in work–life balance	Conceptualization of work–life balance	Representative authors
Role engagement in work life and non-work life	Attentive engagement in multiple roles	The tendency to become fully engaged in the performance of every role in one’s total role system to approach each role and role partner with an attitude of attentiveness and care	Marks (1977), Marks and MacDermid (1996), Sieber (1974)
	Equal time and involvement across multiple roles	Engagement in multiple roles with an approximate equal level of attention, time, involvement or commitment	Kirchmeyer (2000)
	Balanced satisfaction across life domains	Engagement in work and non-work roles to produce an outcome of equal amounts of satisfaction in work and non-work life domains	Clark (2000), Kirchmeyer (2000)
	Balance in time, involvement, and satisfaction across life domains	Allocation of time and psychological energy in a balanced way in work and non-work life while deriving much satisfaction from both work and non-work life	Greenhaus et al. (2003)
Minimal conflict between work and non-work roles	Minimizing role conflict between work and family roles	Satisfaction and good functioning in work and family roles with minimum role conflict	Allen et al. (2000), Clark (2000), Kahn et al. (1964), Galinsky and Johnson (1998)
	Role enrichment with no role conflict	A high degree of role enrichment with a low degree of role conflict in work and non-work life domains	Frone (2003), Greenhaus and Powell (2006)
	Management of resources to minimize role conflicts	Work–life balance is achieved through effective management of role conflict–conflict or interference results when resources to meet role demand are threatened or lost	Fisher et al. (2009), Hobfoll (1989)

Source: Sirgy and Lee (2018, p. 231)

Even so individual companies had initiated work–life programs in the USA at least since the 1930s. The W.K. Kellogg company, for example, started with flexible work hour shifts for their employees around that time resulting in increased employee efficiency and morale (Mbaknol 2020).

The actual term “work–life balance” was first used by a plank in the Women’s Liberation Movement in the UK in the 1980s to advocate maternity leave for women and more flexible work schedules (Kamanu 2020), but gained in importance in the late 1990s (Kuhn 2010). Especially the transition from an industrial to a service society in this so-called New Economy put new and higher demands on employees and squeezed their time (e.g., double income households changing

domestic obligations, more equal separation of home tasks between women and men) (Papmeyer 2018). Consequently, more and more employees suffered from burnout or tinnitus (Hesse/Schrader 2017), depression or, in extreme cases, died from overwork (Walsh 2019). Therefore, the achievement of a work–life balance became a “key concept in the late 20th century” and a multimillion dollar industry (Raja and Stein 2014, p. 71), especially in the Western World. Today, talented individuals in the developed world are becoming more discerning about who they want to work for under which conditions and with whom (Boudreau et al. 2015). Additionally, employers and governments increasingly formulate and implement policies to support the

comanagement of life and work demands (Walsh 2019). Such policies could include the provision for flexible benefits, flexi-time, staggered hours, compressed working hours, time off in lieu, shift swapping, self-rostering, breaks from work, annualized hours, term-time working, job-sharing, working from home, and teleworking (Byrne 2005). Nevertheless, important issues, such as the interference of work and family, are only beginning to gain attention in developing and emerging countries (Cooper 2015).

Disadvantages of the term “work-life-balance”	Alternative and related terms
Suggests a separation of work and life, in which work is not described as part of life	Compatibility of work and family
Suggests cuddling culture and spa oasis	Compatibility of work and private life
Anglicism and <i>en vogue</i> , can lead to misunderstandings	Work life management
“Balance” as ideal condition is factually not achievable	Work–family conflict
	Work atmosphere
	Life satisfaction
	Life domain balance
	Work–life budget
	Quality of life

References: own table after (Papmeyer 2018; Raja and Stein 2014; Beile and Jahnz 2006; Ulich 2005; Sirgy and Lee 2018)

Current Issues and Future Directions

Today, “the entire ‘employee work experience’ is changing” (McLaughlin, Vicere and Ziskin 2019, p. 181). A healthy work–life balance (and work–life balance policies) has become a vital element of the employer–employee relationship (Azmi 2019), in particular through the application of strategies for effective time management to prevent burnout and manage stress (Kumanu 2020).

However, there are a number of issues. The concept of a work–life balance first assumes a strict separation of work and life, where work is not described as part of one’s life. In many cases such separation does not exist. Secondly, it remains unclear if the term is about the temporal compatibility of work and private life or about all dimensions of life and the quality of life (Kratzer et al. 2015).

There are also concerns of more practical nature, e.g., how to manage the performance of people who are not in the office at the same time as the manager or how and to whom work–life balance strategies are applied to or not, leading to perceived favoritism of particular employees over others. Moreover, work–life balance strategies can result in a (perceived or real) loss of team spirit and/or some employees being branded as uncommitted and unmotivated (Byrne 2005).

The table below summarizes the disadvantages of the term work–life balance and alternative and related terms.

Disadvantages of the term work–life balance and alternative terms.

In conclusion, work–life balance or rather the achievement of a positive work–life balance will remain an important topic to achieve higher job satisfaction, retain employees, and increase productivity. The concept has come a long way since John Ruskin outlined the importance of being happy at work for employees and employers in 1851. Moreover, it has to be constantly adjusted to permanently changing working environments and conditions. The current Covid-19 pandemic and its impact on the working environment provides a good example for such changes.

Summary

In today’s society, there is an increasing lack of differentiation between work and private life. This process is driven by globalization, demographic change, digital integration, value change, and structural change. The COVID-19 pandemic has blurred the borderline between the two spheres of life even further. Accordingly, the term work-life balance enjoys high popularity for companies, the public, and sciences. In particular, the achievement of a positive work-life balance under permanently changing working environments and conditions to achieve higher job satisfaction, retain employees and increase productivity has become very important.

Work–Life Budget

► Work–Life Balance

Workplace Health Promotion

Giorgia Nigri

Department of Economics, LUMSA, Rome, Italy

Synonyms

Health; Public Health; SDG 3

Definition

Health inequality is a complex mix of in-work poverty, unemployment, malnutrition, toxic working conditions, lack of social support, unhealthy lifestyles, and status, which undermines the integrity of health policies in each country. No sector in society or active citizenship can ignore responsibility for the promotion of health and social development. The workplace has been established as a fundamental location for health promotion since it directly influences the economic and social well-being of its workers, their physical and psychological health, and the health of their immediate families and communities. Safe workplaces contribute to sustainable development by promoting health through a correct lifestyle at work encouraging personal skills and professional development. It also provides the infrastructure and environment to support the promotion of health to a broad audience.

Introduction

The Universal Declaration of Human Rights states that “the States Parties to the covenant recognize the right of everyone to the enjoyment of the highest attainable standard of physical and mental health” (UN 1948). A key factor is the

social and cultural structure of society as customs and traditions, and support from relatives and communities, help to attain better health conditions (WHO 1948a). Group solidarity involves an idea of shared life or destiny, a sense of belonging and justice toward peers, and integration or rootedness of each member within the group. If it is harnessed toward sustainable goals, it can be a powerful motivating force, and an effective strategy since the areas of social development are at the same time the social determinants of health. Cultural developments that should be promoted refer to material conditions, access to water and environmental protection, formal and cultural structures, elimination of marginalization and exclusion, and education and reduction in illiteracy. Four principles have been identified as essential to the process of priority setting in health: treating people equally and equitably, favoring the excluded, maximizing common benefits, and promoting or rewarding social altruism (UNESCO 2010).

According to the World Health Organization (WHO), determinants that affect health include income and social status, including gender differences, culture and education, support networks and coping skills, genetics and personal behavior, health services and employment conditions, when present. If a genetic disease is present, for example, check-ups need to be more frequent, and access to medical services that prevent and treat the disease are fundamental as well as direct and indirect work permits. Another example is working mothers. Today, working mothers that find time to spend with their children dedicate seven fewer hours per week on housework, six fewer hours sleeping, five fewer hours on personal care, and twelve fewer hours on leisure activities than non-employed mothers. Women, therefore, tend to end up with less pay, less economic security, higher vulnerability to poverty, less leisure time, and less access to top jobs that do not support a healthy or balanced lifestyle, both personal and family-related (Nedelsky 1993).

Loss of sleep, leisure time, and time to oneself is not just a loss of comfort or pleasure, but a threat to autonomy, to the capacity to figure out what is essential in life and how to pursue it. The absence

of care and stability makes people afraid, and in many instances, leads to behavior that causes harm to others as well as to the planet. Having time to cook and enjoy meals, for example, could radically change the need for fast food, rushed meals, meals in front of the television, and the urge to use ecologically unsound shortcuts from paper towels to disposable plastic and aluminum, augmenting both quality of life and environmental sustainability. Also, stress and insecurity make people self-protective and self-focused in ways that make it difficult for them to enter the cooperative relationships necessary both for their well-being and that of others (Nedelsky 2011; Ratti 2017). One of the terrible harms of time poverty is that it makes people ungenerous making them think they do not have time to help, despite their motivation, as per the Samaritan's Dilemma (Stone 2008).

Therefore, in the 21st century, the workplace has been established as one of the priority settings for health promotion, since it influences the physical, mental, economic, and social well-being of workers and in turn the health of their families, communities, and society (WHO 1948a). Workplace Health Promotion (WHP) – defined as the combined efforts of employers, employees, and society to improve the health and well-being of people at work (ENWHP 1996) – is a program of the World Health Organization for the promotion of health through a correct lifestyle at work.

WHP places emphasis on improving the work in organizations, increasing employee participation in shaping the working environment, and encouraging professional development (WHO 1948b). It also offers an ideal setting and infrastructure to support the promotion of health to a broad audience (WHP 2007).

World Health Organization

The World Health Organization (WHO) was established in 1948 and is a specialized agency of the United Nations, a member of the United Nations Development Group, that deals with public health – its objective “is the attainment by all people of the highest possible level of health”

Workplace Health Promotion, Table 1 Roles and functions of WHO

Role	Functions
<i>Guiding on health matters and engaging in partnerships where joint action is needed</i>	Establish and maintain effective collaboration among agencies, governments, and the third sector to strengthen health services and provide facilities
<i>Dissemination of valuable knowledge and monitoring of the implementation of norms and standards</i>	Setting an agenda regarding international health matters to eradicate and mitigate diseases
<i>Articulating ethical and evidence-based policy options</i>	Promote cooperation to attain the advancement of health policies and regulations
<i>Monitoring the health situation and assessing health trends by providing technical support, catalyzing change, and building sustainable institutional capacity</i>	Give appropriate technical and direct assistance
<i>CRVS (Civil Registration and Vital Statistics)</i>	Provide monitoring of vital events (birth, death, wedding, divorce)

Source: Elaboration from <https://www.euro.who.int/en/home>

(Encyclopedia of Public Health 2008). The World Health Organization constitution has been signed by 61 countries and focuses on communicable diseases and non-communicable conditions ranging from development and aging to food security and occupational health (World Health Organization 1948). Its primary roles and functions are highlighted in Table 1.

In addition, the WHO publishes health-specific reports such as the World Health Report and the World Health Survey and organizes networking activities such as World Health Day (WHO 1948a, b; Hoffman and Rottingen 2012).

Workplace Health Promotion

Social and financial conditions that increase the probability to get sick and raise the need for

medical assistance serve as a foundation for the health of the entire population (Kemp 2012). Higher income, social status, and education are linked to better health while illiteracy and poverty bring low health awareness, cause more stress, and bring lower self-confidence, which creates a mental barrier to success and life betterment. Lifestyle is also fundamental, a healthy environment and workplace together with balanced eating, keeping active, and having control over daily setbacks all affect health (Kemp 2012).

The WHO has prioritized the workplace as a setting for health promotion due to the influence it has on all spheres of a person's life. The health of workers, since they are first and foremost people and members of a community, is affected equally by occupational and non-occupational factors such as family welfare, home, and commuting conditions, and community impact. Healthy workers are not only more productive and improve the organizational environment but also raise healthy families, which in turn can bring poverty reduction (WHO 1948a).

An unhealthy lifestyle, on the contrary, may contribute to general lowering of the level of health, can cause absence from work due to sickness, generate productivity loss at work, and reduce the overall ability to work. Workplace Health Promotion Programs (WHPPs) aim to improve lifestyle and consequently improve health, workability, and work productivity (Rongen et al. 2013). Employers who adopt a health promotion program should use best practices to maximize the likelihood of achieving positive results (Goetzel et al. 2014) since well-designed and well-executed programs, together with an organizational culture that can facilitate success, can produce positive outcomes (DeJoy and Wilson 2003; Goetzel et al. 2014).

Workplace health promotion combines the reduction of health risk factors with the enhancement of health-strengthening factors that further promotion strategies (Chu 2000). The processes of protecting workers, their communities, and the surrounding environment are fundamental for sustainable development (WHO 1948a) and have a more significant exponential effect on

Workplace Health Promotion, Table 2 Benefits of workforce health promotion

Organization	Employee
Health and safety program	Safe and healthy work environment
Improved employability and enthusiasm	Enhanced self-esteem and teamwork
Reduced turnover and absenteeism	Reduced stress, fear, and anxiety
Reduced insurance costs	Improved health
Reduced litigation	Increased job satisfaction and internal turnover
Increased productivity	Increased skills for health protection
Better overall environment	Improved well-being
Active participation	Personal development

Source: Elaboration from <https://www.who.int/>

low-paid workers in high-risk occupations since the lack of an adequate quality health care system hinders social development and augments inequities.

Proper attention to workers' health and safety, on the other hand, has extensive benefits for both the organization and its employees (WHO 1948a) as portrayed in Table 2:

Companies can utilize diverse strategies, such as health education, implementation of supportive environments, integration of programs into the benefit structure, and co-created initiatives, at different functional levels – awareness, lifestyle modification, and work environment (Gebhardt 1990). WHP thus functions as the combined stakeholder effort to improve the mental and physical health and well-being of people at work (ENWHP 1996). It supports a participatory process for the implementation of a comprehensive organizational analysis and design aimed at improving health resources in an enterprise (Abraham et al. 2011).

While some health promotion activities in the workplace tend to focus on the prevention of specific risk factors, such as maintaining a correct posture, or on changing personal behaviors, such as healthy nutrition (Rongen et al. 2013), workforce health promotion initiatives

have moved toward a more comprehensive approach.

Summary

The concept of the health-promoting workplace is becoming increasingly relevant as more private and public organizations recognize its importance. A correct balance of physical, emotional, social, spiritual, and intellectual well-being is fundamental to maintain a healthy, qualified, and motivated workforce, which in turn can bring sustainable social and economic development.

Policy implementation, incentive-based benefits, on-site facilities, counseling, and reinforcement strategies can be obtained through a high level of organizational commitment and support from senior management (O'Donnell 2002). Advocacy, including political, economic, social, cultural, environmental, behavioral, and biological factors that can favor good health (Cambridge Dictionary 2019), is also key in overcoming significant barriers to public and occupational health such as poor living and working conditions and in building and maintaining professional health programs through lobbying and commercial campaigning (WHO 1986).

Successful workplace health promotion should be viewed as an ongoing process (WHO 1948a) and include participation by all stakeholders; orientation toward sustainability goals and integration into company practices; comprehensive programs including individual- and environment-directed health strategies (Chu 2000). The effects of these programs include disease prevention, risk reduction, and health awareness – personal, environmental, organizational, and societal factors that have a major impact on employee well-being (WHO 1948a).

International organization towards sustainable development; International organization to promote sustainable business companies

Definition/Description

The World Business Council for Sustainable Development (WBCSD) is a coalition of international companies united by a shared commitment to the environment and sustainable development. It comprises over 200 leading companies from all business sectors and all major economies and almost 70 national business councils. The WBCSD provides a platform for companies to explore sustainable development business models; to share knowledge, experiences, and best practices on energy and climate; and to influence a variety of forums to keep progress toward sustainability (Lovins 2008; Wilkinson and Mangalagiu 2012).

The WBCSD History and Milestones

The WBCSD was initially formed as the “Business Council for Sustainable Development” (BCSD), in 1991, by the Swiss businessman Stephan Schmidheiny and 48 top business leaders interested in the environment, in response to the challenge made by the Secretary-General of the United Nations Conference on Environment and Development (UNCED), Maurice Strong, to promote the concept of sustainable development among the world’s business leaders and companies at the upcoming Rio Earth Summit, in 1992.

At that conference, the council presented an in-depth analysis of how companies can adapt and combine environmental protection with economic growth, in a book named *Changing Course: A Global Business Perspective on Development and the Environment*, which advocated the concept of *eco-efficiency* – doing more with less. This perspective was a major breakthrough at the time, because business leaders at the highest level overcame the prevailing business model “business versus environment” (Najam 1999). Instead, they argued that sustainable development

was not only good for business, but it was a “good business” (Lovins 2008).

Later, in January 1995, the Council merged with the World Industry Council for the Environment (WICE), and formed the WBCSD, secretariat in Geneva, Switzerland, with 120 members.

In 1996, the WBCSD launched a program with the United Nations Environment Programme (UNEP), and the Ceres Initiative on *financial indicators* of sustainable development, and its “International Business Action Plan on Climate Change” (Najam 1999).

In 1997, as part of the Rio+5 celebrations, the WBCSD co-hosts a high-level round table with governments, NGO, and business leaders and releases its report “Signals of Change: Business Progress Towards Sustainable Development” summarizing the progress since the Rio Earth Summit. During that year, WBCSD signed a memorandum of understanding with UNDP to improve environmental performance of companies in developing countries (Najam 1999). It also launched the *What-if?* project with a cross-sectoral approach to solve sustainability challenges. This project used scenarios to explore the possibilities of different future worlds (Wilkinson and Mangalagiu 2012).

Since its beginning, the WBCSD has grown and became a major player, shaping the international discourse on sustainable development. In 2003, it was identified by a World Bank-/IFC-commissioned study as one of the “most influential forums” for companies on corporate social responsibility issues (Wilkinson and Mangalagiu 2012).

Concerns with social matters were highlighted in 2006, when the WBCSD urged its members to pursue *inclusive businesses* to help low-income communities, either by providing employment for people, directly, or as suppliers, distributors, retailers, and service providers or by providing affordable products to meet basic needs (WBCSD 2019k).

In February 2010, the WBCSD publicly released the “Vision 2050: The new agenda for business.” This report presents a vision of a sustainable world by 2050. It also provides the pathway that can lead to that future, by changing governance structures, economic frameworks,

business, and human behavior. This pathway identifies nine key areas of action that must proceed in parallel to keep progress toward sustainability by 2050 (WBCSD 2010). Later that year, on 29 October 2010, the International Chamber of Commerce (ICC), the WBCSD, and the UN Global Compact announced the creation of a temporary coalition of business groups named Business Action for Sustainable Development 2012 (BASD 2012). The purpose of BASD 2012 was to influence the preparatory process of Rio+20 by providing an inclusive platform for exchange of policy recommendations, business solutions, and partnerships aiming to achieve concrete actions and deliverable results toward sustainable development.

In 2011, the WBCSD released a guide for implementing the Vision 2050, with a prescriptive plan of the organizational changes that companies need to engage to integrate sustainability into their strategy and operations (WBCSD 2011).

In 2015, the WBCSD presented at the Conference of the Parties (COP) 21, in Paris, with the Sustainable Development Solutions Network and the International Energy Agency, the “Low Carbon Technology Partnerships Initiative” (LCTPi), an action-oriented program to accelerate the development of low-carbon technologies and scale up deployment with the overall aim to reach a 50% reduction in energy-related CO₂ emissions by 2050 (WBCSD 2015). This was the year all United Nations Member States compromised with “The 2030 Agenda for Sustainable Development” that sets 17 Sustainable Development Goals (SDGs) for achieving peace and prosperity for the people and the planet, now and into the future (UN 2019). Subsequently, the SDGs Compass Guide, developed by GRI, the UN Global Compact, and the WBCSD, was also released. This guide assists companies in adapting their core activities to maximize their contribution to the SDGs by (1) understanding the SDGs, (2) defining priorities, (3) setting goals aligned with SDSs, (4) integrating sustainability into the core business and governance, and (5) reporting and communicating using common indicators and a shared set of priorities (SDGCompass 2015).

In 2017, the WBCSD presents the “Reporting Exchange.” This is a free online

platform with information on sustainability reporting requirements, resources, and indicators, covering 70 sectors and 60 countries, that was developed to assist companies, investors, academics, regulators, and standard setters (WBCSD 2019). This should be useful for academic research because it contains extensive data on regulation and indicators of a wide range of countries.

A year after, in 2018, the WBCSD launched the “Factor 10,” an initiative that offers scalable business solutions toward circular economy. It seeks to encourage leading businesses to use resources wisely, to create processes with the greatest possible value and minimum waste, and to benefit from business circular opportunities (WBCSD 2019).

Governance and Leadership

According to the Articles of Association (WBCSD 2017a), the WBCSD is a nonprofit organization that is financed by annual membership fees and by other incomes, such as fees charged for services, donations, gifts, and contributions to program expenses (Article 3). The membership fees cannot change within a 3-year period.

The governance of the Association comprises the following bodies: the Council, the Executive Committee, and the Auditor (Article 5 of the Association).

The Council is the main body of the WBCSD, and it is composed of all the representatives of the members. These representatives should be the CEO of the companies or an executive board member.

The Council members meet in ordinary session once a year, in the Annual General Meeting, that should take place within 12 months after the financial year end. They can meet in extraordinary session whenever necessary.

The competences of the Council include to discuss strategic issues related to sustainable development and to decide the future direction of the Association. The Council also has the power of supervising the activities of other bodies

and can dismiss them and dissolve the Association.

The Executive Committee is responsible for the operational (day-to-day) management, but this responsibility can be delegated in the CEO of the Association.

This body carries out all acts to pursue the purposes of the Association and to manage the Association’s business. In order to achieve this, the Executive Committee approves the work program, prepares the annual budget to be approved by the Council, approves the annual report and accounts, approves reports and executive briefs released under the name of the WBCSD, handles membership issues, and proposes internal regulations.

Each mandate of the members is 2 years’ duration, and they can serve up to a maximum of three consecutive or nonconsecutive terms (WBCSD 2017a). The members have a non-remunerated role (WBCSD 2017b).

The Executive Committee is composed of up to eighteen (18) members of the Council including the Chair and four Vice Chairs, and it should have diversity in terms of industry, geography, sectors, gender, and sustainability areas and should also be considered the representation from each of the Sector Projects on a case-by-case basis (WBCSD 2017b).

The members’ profile should meet the criteria set out in the Annex B of the “WBCSD Executive Committee Charter.” Firstly, they should have some qualifications, namely, experience in international business and demonstrated innovative leadership to advance the sustainability agenda of an international company, detailed knowledge of and in-depth experience in key sustainability areas, and engagement with key sustainability stakeholders. Additionally, members are selected and recommended according to the following criteria: to be CEO or board executive member in large companies; experience relevant in the main areas of the WBCSD; personal and professional commitment to advance the mission of the WBCSD; engagement and visionary leadership in sustainability; to be able to promote the principles of sustainability reporting, at the level of their company’s activities, in general, and in terms of

social equity, inclusive business, and gender equality; and ability to add value to the WBCSD and to leverage their network (WBCSD 2017b). The profile of the members should be assessed annually and published on the WBCSD’s website.

Since the beginning of the WBCSD, the Chairs of the Executive Committee were the following:

Chairman	Company	Period
Rodney F. Chase	BP	1995
Livio D. DeSimone	3 M	1996/1997
Egil Myklebust	Norsk Hydro	1998/1999
Charles O. Holliday, Jr.	DuPont	2000/2001
Sir Philip Watts KCMG	Royal Dutch Shell	2002/2003
Bertrand Collomb	Lafarge	2004/2005
Travis Engen	Alcan	2006/2007
Samuel DiPiazza	PwC	2008/2009
Paul Polman	Unilever	2010/2011
Charles O. Holliday, Jr.	Bank of America	2012/2013
Paul Polman	Unilever	2014/2017
Sunny Verghese	Olam International Ltd.	2018/2020

The CEO is responsible for the day-to-day management, according to the delegated powers of the Executive Committee, and he may be supported by the Senior Management Team (Article 8). The salary amount of the CEO is determined by the Executive Committee.

The current President and CEO of the WBCSD is Peter Bakker, who has been leading the Association since 2012.

Finally, the Council should appoint a company of auditors, established in Switzerland, for periods of 3 years. The auditor has the responsibility to audit the accounts of the Association and to prepare a report to be submitted to the Annual General Meeting.

According to the website of WBCSD, currently, the governance structure includes also an advisor. Peter White has been involved in the work of WBCSD since 1997 and now, as advisor, has the role of the Ambassador for Biodiversity. In this context, he is working with WBCSD members and partners to bring business solution to the 15th COP of the Convention on Biological

Diversity (CBD), that it will take place in China in 2020, and to other nature-related projects. During the tenth meeting of the COP, held in Japan in 2010, the parties adopted a revised and updated Strategic Plan for Biodiversity for the 2011–2020 period. The 15th COP in 2020 is expected to update the CBD’s strategic plan and adopt a post-2020 global biodiversity framework for the next decade.

Membership Philosophy and Global Network

The eligible members of the WBCSD are companies from around the world seeking to provide business leadership in sustainable development and environmental performance (WBCSD 2017a). These companies can be a member of the WBCSD only by invitation of the CEO, following approval of the Executive Committee of the Association (WBCSD 2018).

The philosophy of the Association is to be open to join new members, and these can come from all sectors and industries. However, there are some membership conditions. The companies must be committed to the mission (“to accelerate the transition to a sustainable world by making more sustainable business more successful”), respect the vision (“to build a world where nine billion people are living well and within the boundaries of the planet, by 2050”), and work in the objectives of the WBCSD (WBCSD 2019a). Members of the WBCSD agree to contribute to the UN Sustainable Development Goals and the WBCSD’s Vision 2050 (WBCSD 2018).

The WBCSD identifies six objectives of the organization that the members should work for, which are the following: (1) be a business thought leader and advocate for sustainable development; (2) participate in policy development to create the right framework conditions for business to make an effective contribution toward sustainable development; (3) develop and promote the business case for sustainable development; (4) develop scalable business solutions, and promote their implementation, for sustainable development; (5) demonstrate and measure the business

contribution to sustainable development and share leading-edge practices among members; and (6) contribute to a sustainable future for all nations (WBCSD 2018).

According to the membership conditions, a member company should accept the following conditions: (1) be independent; (2) be represented on the Council by the CEO or executive-level or board of directors' representative; (3) nominate a liaison delegate, to manage the relationship with the WBCSD; (4) actively support the objectives and work plan of WBCSD; (5) strive for consistency in their advocacy by being transparent about the position and actions the company is taking on sustainable development; (6) operate at the highest levels of transparency, adopting appropriate frameworks to report their Environmental, Social, and Governance (ESG) performance and actively contribute to implementing governance processes that integrate the ESG performance into the review of their business; (7) pay the annual fees; and (8) in case of withdrawal of membership, notice must be provided to the CEO of WBCSD, in written form signed by the Council Member, from 1 January to 30 September, in order to take effect as of the first day of the following year (WBCSD 2018).

Currently, the WBCSD integrate over 200 forward-thinking global companies, and the

distribution of the membership by sector and by region is shown in Figs. 1 and 2. Mostly, members come from Europe and the chemical sector.

One important criticism about the membership philosophy of the WBCSD is that this organization is a “fairly exclusive club” due to the requirement of having an invitation to be a member and a high amount of annual membership fee (Najam 1999). According to this author, the WBCSD remains a coalition of big businesses, predominantly from the advanced industrialized countries; in theory, the smaller companies could be members, but in practice, the priorities and focus concern issues of large corporations.

The projects of WBCSD are led and resourced by members, but, in some cases, they can also have support from partner organizations that provide specific competencies and/or financial resources (WBCSD 2019c). Partners are from a broad range of nonbusiness stakeholders, and they are invited to engage in working groups of the WBCSD, where particular need for external collaboration is identified and can be a factor of success of the program.

There are five categories of partners: implementation, knowledge, outreach, collaboration, and policy partners. In the first and main category, the partners play an instrumental role in the implementation of specific projects due to their

World Business Council for Sustainable Development, Fig. 1 Membership by sector. (Source: Adapted from WBCSD 2019b)

World Business Council for Sustainable Development, Fig. 2 Membership by region. (Source: Adapted from WBCSD 2019b)

expertise, perspective, or credibility. The knowledge partners provide academic or technical expertise. In the third category, the partners provide outreach and advocacy support. Collaboration partners can be major platforms, philanthropy, development agencies, etc. that provide significant systems transformation. And the last category includes governmental or international organizations and governments themselves (e.g., city- or country-level governments, United Nations organizations, European Union).

The collaboration with WBCSD as partner gives access to its Global Network. The Network is an alliance of more than 60 CEO-led business organizations worldwide and encompassing around 5000 companies with the shared commitment to provide business leadership for sustainable development in their respective countries and regions (WBCSD 2019c).

The members of the Global Network help to promote sustainable development at the local and regional levels. The purpose is to work together with WBCSD in order to create the global-local linkages necessary to promote business solutions for a sustainable world.

The Global Network brings value on three main levels: (1) promoting in a global way the programs and activities of the WBCSD,

disseminating information to a wide range of players, and implementing pilot projects; (2) fostering synergies with WBCSD member companies and securing the business license to operate, innovate, and grow in their respective countries and regions; and (3) strengthening Global Network partners' local and regional activities, because they benefit from cooperating with each other due to their similar socio-economic and cultural characteristics and similar sustainability challenges (WBCSD 2019d).

The National Business Council for Sustainable Development or other equivalent national representatives of the WBCSD are an important group of this Global Network, and it is placed in different countries from five continents: Africa (4 countries), Asia (18), Europe (21), Latin America (15), North America, and (4) and Oceania (2).

Programs and Projects to Achieve Systems Transformation

To contribute to the achievement of the SDGs, the WBCSD is currently engaged in six work programs, *Circular Economy*, *Cities and Mobility*, *Climate and Energy*, *Food and Nature*, *Redefining Value*, and *People*, and three Sector Projects,

Forest Solutions Group, Global Agrobusiness Alliance, and Tire Industry Project. Additionally, it is involved in several projects related with these work programs.

The *Circular Economy* program seeks to drive business leadership and practice toward circular economy. It is aligned with the Vision 2050 report. It has the mission of achieving a society with a circular approach to resources, in which the concept of waste is obsolete (WBCSD 2010). This program is operationalized by the *Factor10* Project, which aims to improve eco-efficiency of materials by a factor of 10 in order to eliminate waste (WBCSD 2019e).

The *Cities and Mobility* program incentivizes companies to provide sustainable solutions for the future development of cities in areas such as housing, energy efficiency in buildings, mobility, water, and sanitation. It has two main areas of action – *Sustainable Cities* and *Transforming Mobilities*. The *Sustainable Cities* program area includes two projects: the *SBT4buildings*, which aims to help building and construction companies to reduce carbon emissions and address decarbonization across the life cycle of buildings, and the *Low Emissions Economy Partnership* (LEEP), which seeks to promote local offices which should provide neutral spaces for discussion between public and private stakeholders to create projects, expand local economies, and reduce GHG emissions. The *Transforming Mobilities* area includes two projects: the *SiM-Plify*, designed for providing evaluation tools for the sustainability of cities mobility systems and proposing solutions, and the *Transforming Urban Mobility*, which should guide the conversion of cities mobility to a more sustainable approach (WBCSD 2019f).

The *Climate and Energy* program facilitates the interaction between WBCSD members to address critical industry issues and the sharing of best practices regarding climate and energy issues. This program comprises two areas of action: (1) Energy, which includes several projects such as guidance for energy companies to achieve decarbonization targets (SBT4utilities), guidance to use the available low-carbon energy sources (New Energy Solutions), and promotion

of renewable energy (REscale); and (2) Climate, which includes projects such as developing natural climate for agriculture and forestry sectors (Natural Climate Solutions), establishing a cross-sectorial framework to help companies transform their operations and align with 1.5 °C limit (SOS1.5), and influencing climate policy across industries and countries (Climate Action and Policy) (WBCSD 2019g).

The *Food, Land, and Water* program seeks to promote comprehensive approaches and new technologies to meet the feeding needs of an estimated population of nine billion people by 2050. It addresses several key challenges such as food and nutrition security, smallholder livelihoods, and natural resource efficiency. This program has two areas of action: *Food and Land Use* and *Water*. The *Food and Land Use* area includes three programs: the *Soft Commodities Forum*, the *FReSH*, and the *Climate Smart Agriculture* that aim to develop sustainable agriculture supply chains, to refocus the food system toward healthy products within environmental limits, and to promote agriculture efficiency and resilience while improving the livings of farmers. The second program area, *Water*, includes four projects: the *Water Stewardship*, which involves water risk assessment and sustainable water management; the *Circular water management*, which offers company case studies of circular water management in practice; *Water-Smart Agriculture*, which aims to identify innovative and scalable business solutions to increase efficiency in agriculture, and the *WASH – access to water, sanitation, and hygiene*, which promotes access to water, sanitation, and hygiene at the workplace and through businesses supply chains and communities (WBCSD 2019h).

The *People* program prioritizes the business role in respecting people's rights, needs, and goals in a sustainable way. This program has three main areas of action. The first area, *Social Impact*, includes the *Future of Work* project that aims to promote balance between new technologies and their application in the workplace and what is socially viable and sustainable in the long term; the *Human Rights* project, which seeks to enhance corporate commitment to

human rights; and the *Finance for Social Impact* project that promotes alignment between institutional investors and corporations with social impact. The second area, *Sustainable Lifestyles*, explores the technical, practical, and emotional features of a sustainable world to achieve more sustainable lifestyles. The third area of action regards the *SDGs* and includes the *SDG Sector Roadmaps* project that seeks to help companies to develop sector roadmaps towards the achievement of the *SDGs* and the *SDG Action and Policy* project that supports companies in the internalization of the *SDG* agenda (WBCSD 2019i).

The *Redefining Value* program has three areas of action: *External Disclosure*, *Business Decision-Making*, and *Investor Decision-Making*. The *External Disclosure* area includes the *Task Force on Climate-related Financial Disclosure (TCFD) Preparer Forums* program that helps companies in the oil and gas, electric utilities, chemicals, construction, automobiles and food, agriculture, and forest sectors to disclose quality information on climate-related financial risks and opportunities. This area of action also includes three other projects: the *Reporting Matters* project that analyzes sustainability reports of member companies to provide individual feedback on where to improve; the *Reporting Exchange* program, mentioned earlier; and the *Purpose-Driven Disclosure* project that seeks to align corporate disclosure practices with the needs of financial market participants in order to encourage the flow of capital to more sustainable companies. The *Business Decision-Making* is the second area of action which includes four projects: *Governance and Internal Oversight*, which encourages companies' governance structures to integrate sustainability considerations into their strategies; the *Integrated Performance Management* project, which explores performance management indicators in line with sustainability concerns; the *Measurement and Valuation* project, which encourages convergence and alignment around generally accepted methodologies and datasets that enable consistent and comparable results; and the *Enterprise Risk Management (ERM)* project, in collaboration with the

Committee of Sponsoring Organizations of the Treadway Commission, that provides guidance to integrate social, environmental and governance risks into the ERM framework. The third area of action, the *Investor Decision-Making*, currently comprises a single project, the *Aligning Retirement Assets*, which helps member companies to incorporate sustainable strategies in their retirement plans (WBCSD 2019j).

Summary

Transition of the economy toward sustainable development poses new and complex challenges to businesses. The purpose of the WBCSD is to provide companies a wide range of tools that help them to become more sustainable and successful by incorporating environmental and social concerns into their business models.

From its beginning, in 1991, the WBCSD has launched several programs, participated in high-level round tables with governments, international organizations, NGO, and business leaders, and released significant reports with pathways to a sustainable future, among other initiatives.

The governance of this organization is the responsibility of its members. The Council is the main body of the WBCSD, and it is composed of all the representatives (CEO of the companies or an executive board member) of the members. The Executive Committee is composed of up to eighteen (18) members of the Council including the Chair and four Vice Chairs, and it should have diversity in terms of industry, geography, sectors, gender, and sustainability areas and should also be considered the representation from each of the Sector Projects on a case-by-case basis.

The eligible members of the WBCSD are companies from around the world, and from all sectors and industries, seeking to provide business leadership in sustainable development and environmental performance. These companies can be a member of the WBCSD only by invitation of the CEO, following approval of the Executive Committee of the Association.

The WBCSD is financed by annual membership fees and by other incomes, such as fees charged for services, donations, gifts, and contributions to program expenses. These financial resources support the development of a wide range of projects.

In some cases, the projects could also have support from partner organizations providing specific competencies and/or financial resources. Partners are from a broad range of nonbusiness stakeholders, and they are invited to engage in working groups of the WBCSD, where particular need for external collaboration is identified and could be a factor of success of the program. This collaboration gives access to the Global Network of the WBCSD.

The Global Network is an alliance of more than 60 CEO-led business organizations worldwide and encompassing around 5000 companies with the shared commitment to provide business leadership for sustainable development in their respective countries and regions. The National Business Council for Sustainable Development or other equivalent national representatives of the WBCSD are part of this Global Network.

The WBCSD is presently engaged into six work programs aligned with the SDGs. These programs pursue several goals such as circular economy; mobility transformation and sustainable cities; climate and energy solutions; water, food, and land use; redefinition of companies' value; and integration of people's concerns.

Currently, the WBCSD is a major player in the international arena and a leading voice of large businesses for sustainable development.

Synonyms

Davos Summit; WEF

Definition

The World Economic Forum is a nonprofit organization headquartered in Geneva, Switzerland, that is most well-known for its annual meetings in Davos, Switzerland, on which top political and business leaders, as well as renowned intellectuals, scientists, and public figures, gather to discuss emerging and global economic and social issues in a public-private dialogue fashion (WEF 2020c). Each year, the Annual Meeting is held in January and is appointed a specific theme which usually revolves around crucial global economic and social tendencies (Pigman 2007, p. 17).

Since 2007, the WEF organizes the so-called “Summer Davos” Annual Meeting of the New Champions, which is held in China in September, and focuses on companies, markets, and growth (Lim 2012).

The WEF was founded as an independent international nonprofit organization in 1971 by Dr. Klaus Schwab, a German business professor at the University of Geneva, and it initially was named the European Management Symposium (Pigman 2007, p. 7). Initially a forum for regional management topic discussion, after the fall of the Bretton Woods system, it started to include major social and economic topics into the discussion agenda, and it gradually grew to a global issue discussion forum. The name World Economic Forum was adopted in 1987 (Pigman 2007, p. 14).

Founded on the stakeholder theory, the WEF has stated accountability to all parts of society a priority (WEF 2020a). For this reason it strives to engage many kinds of organizations and individuals in the debate – from both public and private sectors, international and domestic organizations, academics, and media (WEF 2020c).

Emphasizing on the importance of international cooperation towards free trade and exchange, the WEF is usually seen as a focal point for promotion of the free-market globalization agenda. It is often criticized by anti-globalist and alter-globalist international activists and organizations (Pigman 2007, p. 123). Despite such criticism, The WEF is generally considered a crucial meeting for the international community as a

whole as it provides an opportunity for coordination and exchange of information and opinions on important global topics between top officials and company executives. The WEF also provides information to a larger audience through issuing different materials such as its research reports and video recording of discussion panels.

The World Economic Forum in Brief

The main aim of the WEF, as its official organizational statements claim, is to promote “entrepreneurship in the global public interest.” (WEF 2020a).

The main vision of the WEF is that a free global market system and economic globalization is good for all and that the proper development and spirit of such a system should be created and promoted by all stakeholders in society – firms, governments, international organizations, and civil society (WEF 2020a).

The WEF is headquartered at Geneva, Switzerland (WEF 2019c).

The flagship event of the WEF is the annual Davos Forum, which takes place in the Swiss resort at the end of January of each year (Pigman 2007, p. 4). Each year it gathers thousands of delegates and holds hundreds of sessions.

Except the Annual Davos Forum, the WEF also holds regional meetings all year-round. It holds such regional events all over the globe both in developed and developing countries. Regional WEF forums have been held in Europe, the Middle East, India, Latin America, Africa, Central and East Asia, etc. (WEF 2020b).

Since 2007 the WEF also holds the Annual Meeting of New Champions, also called “Summer Davos,” which takes place each year in China, and focuses on innovative and emerging markets and companies (Lim 2012).

Besides the organization of the WEF conferences, the World Economic Forum publishes a range of reports and white papers on different global issues. Some of the more significant WEF reports include the Annual World Economic Forum Report, the Global Competitiveness Report, the Global Information Technology Report, etc (WEF 2019a).

Criticism of World Economic Forum

The WEF is a proponent of discussion about globalization. It is known to promote a globalization agenda, focusing on convergence and market liberalization objectives (Sparke et al. 2009). It engages the topic discussion among scholars, the media, governments, and civil society.

Through its support of globalization, the WEF has been seen by anti-globalist and alter-globalist movements as a structure that is responsible for the increase of global inequality (Pigman 2007, p. 18). Alternative meetings, such as the World Social Forum, have been created as a counter to the WEF agenda (Sparke et al. 2009).

Some international NGOs, such as Greenpeace (Pigman 2007, p. 126), have been criticizing the WEF for lacking a proper address on climate issues (Greenpeace 2019).

Another criticism that the WEF is subject to is related to exclusivity, with some authors claiming it a “transnational elite club.” (Graz 2003). With the WEF having a membership network of mostly large enterprises, as well as institutional affiliates such as governments and international organizations, it has faced critique that in discussing global issues it should open to more representation of smaller business and civil society (Pigman 2007, p. 125).

In the organizational change from a management club towards a global issue discussion forum, the WEF has been making attempts at widening the representation of different social groups in the annual meetings (Pigman 2007, p. 5). Access to the annual meetings has been much harder for companies from developing countries. In an effort to formally overcome this imbalance, the WEF has adopted some measures, such as lowering its annual turnover limit and by inviting CEOs of companies from emerging markets.

The formal strive for a more open Davos dialogue is the Open Forum Initiative which is free of charge and welcomes government officials and company CEOs as well as artists, civil society leaders, and innovative entrepreneurs who share their opinions on the topics of discussion (WEF 2019b). The WEF has addressed the transparency and access issues also by mobilizing social network technologies – for example, by streaming the Davos sessions online on platforms such as

YouTube and upholding an active Twitter communication channel.

Summary

Considered by some a transnational elite club, the World Economic Forum has been facing biases in global society. However, the organization is of importance for international coordination, as it is a platform for communication for many of the most powerful representatives of states and businesses. With the strive for inclusion of media and academia, the WEF has been trying to evolve as an organization from being “an elite club” towards a platform organization that fosters “entrepreneurship in the global public interest.”

Description

The World Economic Forum (WEF) is the international nongovernmental lobbying organization for public-private cooperation. It aspires to achieve the greatest degree of sustainability for its offices, as well as improve the sustainability performance of its events and incorporate sustainability principles into its business and worldwide operations. Established in 1971, WEF was founded by German engineer and economist, Professor Klaus Schwab, initially under the name of European Management Forum. According to the Forum, a self-selected alliance of multinational firms, governments, and civil society

organizations is best suited to manage a globalized world. The WEF gathers the most influential public and private organizations and their leaders around the common goal of shaping the future of the globalized world. Mostly recognized by its annual meetings deep in the Swiss Alps at Davos, WEF established an elite reputation in political and business milieus, along with the accompanying criticism from various anti-establishment circles directed towards its undemocratic decision-making, elitism, and agendas such as *The Great Reset* with its controversial setup in terms of information privacy, technological progressivism, etc.

The Origins and the Mission of WEF

The initial vision of the founder of WEF, Professor Schwab, was predicated upon the

so-called *stakeholder theory* which states that companies have other responsibilities besides the ones towards their shareholders (Schwab and Kroos 1971). According to Schwab, stakeholders such as customers, society, collaborators, and others illustrated in Fig. 1 also have rights to claim the benefits arising from the business activity of the company, since they are all under the influence of the latter. Out of this doctrine, the Davos Manifesto was derived as well, as a code of ethics for future Davos meetings and its endeavors.

Since its inception, WEF has been working with global partners to make a positive change in the world, resulting in historic initiatives, industrial breakthroughs, economic solutions, and tens of thousands of projects and collaborations. In this sense, WEF positioned itself as the frontline advocate of corporate social responsibility (CSR) with the emphasis on sustainability in recent decades.

World Economic Forum (Davos) II, Fig. 1 The company surrounded by its stakeholders. (Created by the template from WEF 2022e, 15)

Accordingly, the broad scope of areas influenced by WEF is ideated around the fundamental axis of sustainable development. The organization's influence now stretches over the whole world and its involvement in determining economic, management, and social policies have been spectacular during its 52 years. The mission of the WEF has therefore always been to transform and regulate the raw shareholders' capitalism into the stakeholders' capitalism.

Activities and Centers

In addition to the activities related to CSR, through its history, WEF has been influential in mediating various types of conflicts since 1971 until today. Averting war between Greece and Turkey in 1988 is a good example for this. Furthermore, 2 years later, Davos had its role in German reunification as well, where a session on the "New Europe" also took place, bringing together the heads of Western and Eastern European countries for the first time. The famous handshake between Mandela and de Klerk, which symbolized the end of apartheid, happened through the mediation of WEF as well.

Some of the most important WEF events and achievements are enumerated in Table 1.

The Forum, with its chairman Klaus Schwab, is also widely known as a key ambassador of technological innovation throughout the fourth industrial revolution (*Industry 4.0*). The Forum is continuously expanding its impact through various specialized centers. In 2016, WEF established *The Centre for the Fourth Industrial Revolution* (C4IR) in order to "help leaders anticipate, understand and shape the trajectory of technological change for human-centered, society-serving outcomes" (WEF 2022a). Furthermore, *The Centre for Nature and Climate* is working to speed up action on climate change and environmental sustainability, food systems, the circular economy and value chains, and the future of international development. There is also *The Centre for Cybersecurity*, intended to meliorate coordination of the global response to systemic cybersecurity issues. *The Centre for the New Economy and Society* should be mentioned

World Economic Forum (Davos) II, Table 1 World Economic Forum: a timeline of highlights. (Created according to WEF 2022d)

Year	Theme
1971	The first Davos
1973	A prescient warning on the environment – The Davos manifesto
1976	Bridging the Arab world and the west
1979	Opening the door to China
1987	The beginning of the end of the cold war
1988	Averting war between Greece and Turkey
1990	German reunification and a new Europe
1992	Mandela and the end of apartheid
1998	The birth of the G20
1999	Kofi Annan and the global compact
2000	Bill Clinton and the launch of GAVI
2002	"Davos" moves to New York after 9/11
2005	The launch of the gender gap report
2007	A looming crisis
2012	Bringing in young leaders
2016	Mastering the fourth industrial revolution
2018	"A real panel, not a manel"
2019	Nature's emergency
2020	Stakeholders for a cohesive and sustainable world
2021	The great reset (canceled)
2022	The Davos agenda

as well, especially in terms of its most important output – annual Global Risk Reports.

Besides Global Risk Reports, WEF is issuing other various kinds of whitepapers and annual reports such as Global Competitiveness Reports, Global Gender Gap Reports, Future of Work Reports, etc. All these serve as outlooks for further lobbying and influencing decision-makers choices.

Offices and Locations

The Forum is headquartered in Cologny, Switzerland, with a stunning view of Lake Geneva. This location employs around 600 people. The WEF's New York office is home to Industry and System Initiatives, as well as regional and business teams serving North and Latin America. The Forum's Centre for the Fourth Industrial Revolution is based in San Francisco and is situated in the

Presidio national park. The WEF's Beijing Representative Office was founded in 2006 with the goal of integrating Chinese leaders from government, business, and academia into the Forum's communities and activities. In 2009, the WEF also established the Japan Representative Office. The Tokyo office supports the Forum's work in all sectors, notably in Japanese interactions with government, business, and the general public. The Centre for the Fourth Industrial Revolution India, which was established in October 2018, collaborates with the Indian government on a national level to codesign new policy frameworks and protocols for emerging technology with leaders from business, academia, start-ups, and international organizations.

Organization Governance

Professor Klaus Schwab is the executive chairman of the Forum. The Board of Trustees, with its members from business, politics, academia, and civil society, is guiding and overseeing the Forum's work. The Managing Board, an executive body of the WEF, is chaired by Forum's president, a former Norwegian minister, Børge Brende.

Partners and Delegates

The delegates list for Davos meetings don't get officially published, although they are often brought to the public by media leaks (Quartz 2020). Davos meetings regularly gather world's most renowned political and business leaders, presidents, prime ministers, CEO's, and other influential individuals and organizations. Unlike the delegates list, the list of all WEF's partners, counting more than 1000 companies and groups, is transparently announced and accessible via their official site (WEF 2022b). Among them, the Forum officially enumerated 105 strategic partners, including the largest companies and associations from all industries such as: Amazon,

Google, IBM, GE, Pfizer, Goldman Sachs, and many more.

Funding

The WEF is officially run as a nonprofit, politically neutral organization. The Forum receives a big portion of its income from the world's most powerful corporations, which join as members and partners in order to participate in its operations. Depending on the amount of commitment, membership, and partnership fees range from CHF60,000 to CHF600,000. The Forum also collaborates with government agencies to achieve project or initiative goals, and these agencies may support such efforts through the Forum in some cases. Nonbusiness attendees at the annual meeting, such as leaders from civil society, the arts, young global leaders, media leaders, heads of state, and ministers from more than 70 countries, do not pay a fee to attend.

The Great Reset Agenda

The idea of *The Great Reset* was launched along with the emergence of Covid-19 crisis and its social, political, and economic implications. The WEF proposes *The Great Reset* as an opportunity to shape and plan the world's future, and reestablish the goals and directions for the whole global economy and society. As Schwab noted, "The pandemic represents a rare but narrow window of opportunity to reflect, reimagine, and reset our world" (WEF 2022c). *The Great Reset*, a book, was published in July 2020, where Schwab and Malleret described a strategy for resetting five macro categories of the world: economic, societal, geopolitical, environmental, and technological. Their main argument is that "we should take advantage of this unprecedented opportunity to reimagine our world, in a bid to make it a better and more resilient one as it emerges on the other side of this crisis" (Schwab and Malleret 2020).

Criticism

The Davos conference has had its opponents since its inception. In his book *The World Economic Forum: A Multi-Stakeholder Approach to Global Governance*, Pigman wrote:

The critics of the World Economic Forum can be divided broadly into two levels: those who question the Forum at an existential level – its mission, its membership, its methods of operation – and those who criticize it at an instrumental level, arguing that the Forum is not doing what it intends to do as well as it might or ought to do (Pigman 2006, 123)

And this distinction is still valid. Existential level critics often consider Forum as a body for imposing neoliberal globalization. Instrumental level criticism, on the other hand, is commonly directed towards some particular practices or perceived governance inefficiencies. While critics of the first kind openly stand against the Forum's mission, instrumental critics often sympathize with the desires of the Forum but criticize it in terms of nonadherence to their own principles, etc. One of the most notable detractors of the first kind is undoubtedly an American political scientist, Samuel P. Huntington who coined the term “Davos Man” referring to the members of global elite who “have little need for national loyalty, view national boundaries as obstacles that thankfully are vanishing, and see national governments as residues from the past whose only useful function is to facilitate the elite's global operations” (Huntington 2004). The notion of *Davos Man* helped stir up further criticism such as the one coming from Peter Goodman in his newly published book *Davos Man: How the Billionaires Devoured the World* (2022) which Joseph Stiglitz described as a “deadly serious account of the profound damage the billionaire class is inflicting on the world.”

Summary

The World Economic Forum (WEF) is an international public-private partnership organization

focused on lobbying and leading societal and technological changes in the world by engaging leaders in collaborative efforts. It produces research reports, organizes events, and fosters public-private partnerships to address global challenges. Critics have raised concerns about its elitism and business influence, but it remains a prominent platform for dialogue and action on global issues.

WSF

Definition

The World Social Forum (WSF) is an annual meeting of civil organizations, activists, and influencers, that strives to provide an alternative scenario for economic and social growth and development opposing the World Economic Forum in Davos (WSF 2001).

The first WSF meeting was held in Porto Alegre, Brazil, in 2001. It was organized as an event opposing the World Economic Forum in Davos. It was institutionally supported by the Brazilian government. The WSF is a meeting that provides a platform for discussion of issues and coordination of actions between organizations and movements of civil society and nongovernmental organizations. One of its main principles is to work in a plural, diversified, and nonparty context (WSF 2001).

After the first meeting in Porto Alegre, the WSF issued its charter of principles (WSF 2001). It established the basic principles of the Forum which state that the WSF is an open meeting place for reflective thinking, formulation of proposals, and free exchange of experiences by groups and movements of civil society that are opposed to neoliberalism. The charter defines the WSF as a world process, in which all meetings have an international dimension (WSF 2001). The forum aims to provide alternative approaches to global economic and social issues focusing on the understanding that globalization should be approached from the context of global solidarity.

The slogan of the forum that has gained popularity is “Another World is Possible.”

History of the WSF

The WSF is conceived to be an international society, much in the way Hedley Bull considers the term, namely “make a conscious social contract by instituting rules and machinery to make their relations more orderly and predictable to further certain shared principles and values” (Watson 1987, p. 147). The participating actors are all formal organizations, most of which come from the nongovernment sector, or civil rights organizations, political activists, and leaders, and they gather in the WSF via sharing common views for socioeconomic development. The WSF strives to provide an alternative solution for economic growth and development not only on national level, but on an international level as well (WSF 2001).

Created as an alternative to the Davos World Economic Forum, the WSF aims to provide a platform for the promotion of ideas for economic globalization that are different from the Davos perspectives. The WSF supports the idea of more equity instead of more efficiency in terms of economic development, thus positioning itself on the side of equity-driven public policy in the more general economic policy debate. It is often associated with the nongovernmental organizations of the global left (Santos 2008).

The WSF has had a number of events since its initial meeting in Brazil in 2001 (Table 1). The first few events had taken place in Brazil, but in recent years annual meetings have been hosted by a number of countries. A list of all WSF Annual Meetings is provided below.

Founders and Organizers

The WSF was proposed by Brazilian civil society organizations, and were politically supported by the Workers’ Party of Brazil. The idea received international support from organizations from various background of social and economic spheres. It received financial support from organizations like Novib, the Netherlands Organization for International Development Cooperation (Bello 2002). With the permission of the Brazilian

local authorities of Porto Alegre and the state government of Rio Grande do Sul, the first WSF took place in Porto Alegre, Brazil, in 2001 (Sparke et al. 2005).

The original 2001 version of the WSF charter of principles was signed and adopted by the following organizations (WSF 2001):

- Brazilian Association of Nongovernmental Organizations (ABONG)
- Association for the Taxation of Financial Transactions for the Aid of Citizens (ATTAC)
- Brazilian Justice and Peace Commission (CBJP)
- National Council of Bishops (CNBB)
- Brazilian Business Association for Citizenship (CIVES)
- Central Trade Union Confederation (CUT)
- Brazilian Institute for Social and Economic Studies (IBASE)
- Center for Global Justice (CJG)

- Movement of Landless Rural Workers (MST) (WSF 2001)

After the first WSF, the summit developed into a large-scale meeting of participants from various backgrounds. The organization of WSFs differs from the traditional top to bottom fashion of other global summits (such as United Nations conferences, the World Economic Forum in Davos, etc.). Activities in WSF are decided by the participants, and often are self-organized by them (Smith et al. 2012).

Organization of the WSF is not hosted by a permanent structure that facilitates it. Rather, an organizational structure is created ad hoc for the needs of the event. Organizers of the forums do not exercise control over them and they only facilitate the events. For this reason there is generally no traditional adoption of official documents like the typical legal or political documents adopted in conferences hosted by international organizations.

Thus, the WSF is considered to be neither a movement nor an entity, but a meeting place of organizations of different social spheres and civil society which aims to provide a forum for communication between those organization, and opportunity to build alliances and launch initiatives (Whitaker 2005).

Since the first WSF in 2001, the venues of the global and local events have changed, with later summits taking place in multiple venues simultaneously (Hammond 2006). Local versions of the forum that have sprung out have acquired as much attention as the original forum – the Indian Social Forum (ISF) (Rucht 2012) and the European Social Forum (ESF) (Fiedlschuster 2018) being the most prominent of them, and the so-called World Social Forum process evolving (Rucht 2012).

Participants

Keeping up with the bottom-up approach to organization of events, the WSF has attracted multiple organizations from sectors such as agriculture, women's organizations, environmental protection organizations, political rights activists, etc. (WSF 2016).

Participation in the forum is available for registration, and organizations that want to attend could sign up. Later WSFs provided the opportunity for organizations to register for participation through the WSF summit websites (WSF 2016, 2018). Some social forum events have been free of participation fees as well which makes them more attractive for organizations (Fiedlschuster 2018).

The WSF is considered to be a platform for and a manifestation of contemporary global justice movements (GJMs) and transnational activism (Rucht 2012). The WSF is for that reason characteristic with participant heterogeneity, with a variety of civil society activists and organizations gathering around the alternative opinions on economic globalization.

The WSF is not entirely an informal summit, as it was established through the collaboration between formal political and economic institutions – from the Brazilian Workers Party, the municipal government of Porto Alegre, the state government of Rio Grande do Sul, with the participation of French journal *Le Monde Diplomatique*, and formal nongovernmental organizations (Sparke et al. 2005).

However, the forum is typically attended by a large proportion of informal groups and actors. Sparke et al. list only a few such participants – from the Brazilian Landless Rural Workers movement, The World Women's March, The Women's International Coalition for Economic Justice (WICEJ), The Land Action Research Network, The Halifax Initiative Coalition, etc. (Sparke et al. 2005).

No WSF ever ends with concluding documents, and each organization or alliance of organizations can propose measures which are binding on them (Whitaker 2005). Article 6 of the WSF's charter of principles states that the event itself is not to represent all participants through formal statements (WSF 2001). Participants in the WSF are free to issue statements and proposals on their behalf, and the established practice is for them to do so. As a result, WSF meetings result in a significant number of documents adopted by separate groups of participants. Whitaker notes that for the 2005 WSF

alone 352 proposals were presented at the closing ceremony (Whitaker 2005).

Institutional partners of the WSF include the United Nations Educational, Scientific and Cultural Organization (UNESCO), which is the main United Nations agency that facilitates UN-WSF communication and dialog through its programs (Solinis 2004).

Role of Companies and Impact on Social Sustainability

The WSF is not typically attended by business and companies. The forum lacks efficient structure of business-society dialog.

However, the role of the forum in terms of business-civil society dialog is not insignificant. It is stated in the charter of principles of the WSF, and statements issued by WSF participants are often oriented towards opposing multinational companies and raising a voice in defense of socially fair economic activity. In this relation, it is the WSF's value that such statements are issued, as they are dedicated to promoting social fairness, and social sustainability. The forum has proven to be a useful foci of economic globalization opposers, with discussions, statements, and action taken on different economic issues. One classic example is the WSF discussions and action taken in relation to the proposed Free Trade Area of the Americas (FTAA) agreement, as opposers of the agreement gathered at the WSF (Sparke et al. 2005).

Political Significance of the WSF Summits

Since the first WSF in 2001, the summit has become one of the important spaces for meeting and mobilizing diverse social movements that oppose the dominant strain of economic and financial globalization (Grzybowski 2006).

The forum has become an influential platform for discussion of issues such as women's rights, LGBTQ rights, climate justice as a part of social

justice, ban of nuclear weapons, and humanitarian assistance (WSF 2016).

Thus, the WSF became one of the most important global arenas for social movements and networks that seek democratic transformations of the capitalist world system. As Teivainen observes, the WSF is an attempt to facilitate and debate transformations in local, national, and global contexts (Teivainen 2012). It has been recognized that the WSF events are a key mean of communication and manifestation of the still amorphous concept of global civil society. However, the global impact of the forum events remains somehow questionable, as opposed to the very tangent and unquestionable effects of its main rival – the World Economic Forum.

However, the political essence of the WSF is still struggling with problems of internal organization and political identity, as reaching a status of a truly global event is sometimes contested. The spread of the social forum participation has remained relatively local (Reese et al. 2012), despite the desire for global representation. As surveys show, social forum events around the world remain quite local, in some cases with 80% of participants being representatives of local social entities (Smith and Smythe 2012). Authors have commented that too often are travel costs the factor that impedes participation of more international representatives (Smith and Smythe 2012). It is still not clear on whether digitalization of social interaction will benefit the forum effects enough in order to make the WSF more significant an event in global aspect.

Summary

The WSF is a structure of annual meetings aiming to provide an alternative to the Worlds Economic Forum (Davos) paradigm. It claims that it is more important for globalization to be fair and be directed towards equity instead of efficiency. The political significance of the social forums is focused on providing an alternative standpoint to economic globalization. However, social forums lack a focus on business–society relationship and

has not so far been a place for joint company–society discussion and adoption of sustainable management and corporate social responsibility practices.
